# 1. General notes

*About Taiga instance and URLs used in this document*

**NOTE** All API calls used in the documentation are referred to a local taiga instance API running on localhost:8000, so if you use another instance remember to change the url.

For example, if you want to perform the tests against our own instance, you should use <https://api.taiga.io/api/v1> instead of <http://localhost:8000/api/v1>.

## 1.1. Authentication

### 1.1.1. Standard token authentication

To authenticate requests an http header called "Authorization" should be added. Its format should be:

```
Authorization: Bearer ${AUTH_TOKEN}
```

This token can be received through the [login API](#)

To provide an example, the following can be used within a Bash script running on Ubuntu - customise as appropriate for your system configuration.

- Install `jq` (a command-line JSON processor):

```
$ sudo apt-get install jq
```

- Bash snippet:

```

#!/bin/bash
# Request username and password for connecting to Taiga
read -p "Username or email: " USERNAME
read -r -s -p "Password: " PASSWORD

DATA=$(jq --null-input \
    --arg username "$USERNAME" \
    --arg password "$PASSWORD" \
    '{ type: "normal", username: $username, password: $password }')

# Get AUTH_TOKEN
USER_AUTH_DETAIL=$( curl -X POST \
    -H "Content-Type: application/json" \
    -d "$DATA" \
    https://api.taiga.io/api/v1/auth 2>/dev/null )

AUTH_TOKEN=$( echo ${USER_AUTH_DETAIL} | jq -r '.auth_token' )

# Exit if AUTH_TOKEN is not available
if [ -z ${AUTH_TOKEN} ]; then
    echo "Error: Incorrect username and/or password supplied"
    exit 1
else
    echo "auth_token is ${AUTH_TOKEN}"
fi

# Proceed to use API calls as desired
...

```

- If unable to install `jq`, it is possible (but not recommended) to use `grep` and `cut` to extract the value of `auth_token` from the JSON `user auth detail object` - use the following line instead:

```

AUTH_TOKEN=$( echo ${USER_AUTH_DETAIL} | grep -Po '"auth_token":.*?[^\\"], ' | cut -d\" -f4 )

```

## 1.1.2. Application token authentication

This kind of tokens are designed for allowing external apps use the Taiga API, they are associated to an existing user and an Application. They can be manually created via the django ADMIN or programmatically created via API.

They work in the same way than standard Taiga authentication tokens but the "Authorization" header change slightly. Its format should be:

```
Authorization: Application ${AUTH_TOKEN}
```

The process for obtaining a valid token consists in:

- [Checking if there is an existing application token for the requesting user](#)
- [Requesting an authorization code for the requesting user if it doesn't exist yet](#)
- [Validating the authorization code to obtain the final token](#)
- [Decyphering the token](#)

### **Checking if there is an existing application token for the requesting user**

A GET request must be done to the applications resource including the application id in the url and specifying the token endpoint:

```
curl -X GET \
  -H "Content-Type: application/json" \
  -H "Authorization: Bearer {AUTH_TOKEN}" \
  https://api.taiga.io/api/v1/applications/5c8515c2-4fc4-11e5-9a5e-68f72800aadd/token
```

The API will answer with info about the application and the token:

```
{
  "user": 4,
  "id": null,
  "application": {
    "id": "a60c3208-5234-11e5-96df-68f72800aadd",
    "name": "Testing application",
    "web": "http://taiga.io",
    "description": "Testing external app",
    "icon_url": "https://tree.taiga.io/images/beta.png"
  },
  "auth_code": null,
  "next_url": "http://tree.taiga.io/redirect?auth_code=None"
}
```

If id and auth\_code are null it means there is no application token generated and you need to [authorize one](#). If they are not null you can jump to the [validation step](#).

### **Requesting an authorization code for the requesting user if it doesn't exist yet**

The request should include:

- application: the application id for the requested token

- state: an unguessable random string. It is used to protect against cross-site request forgery attacks. The API will include this value when the validation process is completed so the final app can verify it matches the original one.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer
eyJ1c2VyX2F1dGhbnRpY2F0aW9uX2lkIjo0fQ:1ZX33b:QnAN3EcuChLoRVf3CdybWEi20Eg" \
-d '{
    "application": "a60c3208-5234-11e5-96df-68f72800aadd",
    "state": "random-state"
}' \
https://api.taiga.io/api/v1/application-tokens/authorize
```

The API answer will be something like:

```
{
  "auth_code": "c8bfacba-5236-11e5-b8f6-68f72800aadd",
  "state": "random-state",
  "next_url": "asd?auth_code=c8bfacba-5236-11e5-b8f6-68f72800aadd"
}
```

The obtained auth\_code must be validated as described in the [validation step](#).

### Validating the authorization code to obtain the final token

Now the external app must validate the auth\_code obtained in the previous steps with a request including:

- application: the application id for the requested token
- state: an unguessable random string. It is used to protect against cross-site request forgery attacks. The API will include this value when the validation process is completed so the final app can verify it matches the original one.
- auth\_code: the authorization code received on previous the steps.

```

curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer
eyJ1c2VyX2F1dGhbnRpY2F0aW9uX2lkIjo0fQ:1ZX33b:QnAN3EcuChLoRVf3CdybWEi20Eg" \
-d '{
    "application": "a60c3208-5234-11e5-96df-68f72800aadd",
    "auth_code": "21ce08c4-5237-11e5-a8a3-68f72800aadd",
    "state": "random-state"
}' \
https://api.taiga.io/api/v1/application-tokens/validate

```

The API answer will be something like:

```
{
  "cyphered_token": "eyJlbmMi0iJBmjU2R0NNIiwiYWxnIjoiQTEyOEtXIn0.E-Ee1cRgG0JEd90yJu-
DgI_vwKHTHdPy2YHRbCsMvfiJx00vR12E8g.kGwJPnWQJecFPEae.ebQtpRNPbKh6FBS-
LSUhw1xNARl0Q5loC04fAk00LHFqcDpAwba7LHeR3MPx9T9LfA.KM-Id_041g80dWaseGyV8g"
}
```

## Decyphering the token

The token is cyphered using JWE with A128KW as algorythm and A256GCM as encryption. Both parts (Taiga and the external application requesting the token) must know about the encryption key used in the process (in Taiga it's an attribute of the application model).

- A python snippet for decyphering the token:

```

from jwkest.jwk import SYMKey
from jwkest.jwe import JWE
key ="this-is-the-secret-key"
cyphered_token="eyJlbmMi0iJBmjU2R0NNIiwiYWxnIjoiQTEyOEtXIn0.H5jWzzXQISSh_QPC05mWhT0EI9RRV
45xA7vbWoxeBIjiCL3qwAmlzg.bBWVkwGTkta5y99c.ArycfFtr1mWgyZ4lwXw_JiSVmkn9YF6Xw1h8nVDku0BLW8
kvaxNy3XRbbb17MtZ7mg.pDkpgDwffCyCy4sYNQI6zA"
sym_key = SYMKey(key=key, alg="A128KW")
token=JWE().decrypt(cyphered_token, keys=[sym_key])
print(token)

```

When decyphering it correctly you will obtain a json containing the application token that can be used in the Authorization headers

```
{  
  "token": "95db1710-5238-11e5-a86e-68f72800aadd"  
}
```

## 1.2. OCC - Optimistic concurrency control

In taiga multiple operations can be happening at the same time for an element so every modifying request should include a valid version parameter. You can think about two different users updating the same user story, there are two possible scenarios here:

- They are updating the same attributes on the element. In this situation the API will accept the first request and deny the second one because the version parameter will be considered as invalid.
- They are updating different attributes on the element. In this situation the API is smart enough for accepting both requests, the second one would have an invalid version but the changes are not affecting modified attributes so they can be applied safely

The version parameter is considered valid if it contains the current version for the element, it will be incremented automatically if the modification is successful.

## 1.3. Pagination

By default the API will always return paginated results and includes the following headers in the response:

- x-paginated: boolean indicating if pagination is being used for the request
- x-paginated-by: number of results per page
- x-pagination-count: total number of results
- x-pagination-current: current page
- x-pagination-next: next results
- x-pagination-prev: previous results

**Disabling pagination** can be accomplished by setting an extra http header:

```
x-disable-pagination: True
```

## 1.4. Internationalization

The API returns some content translated, you can specify the language with an extra http header:

```
Accept-Language: {LanguageId}
```

The LanguageId can be chosen from the value list of available languages. You can get them using the [locales API](#).

## 1.5. Throttling

If the api is configured with throttling you have to take care on responses with 429 (Too many requests) status code, that mean you reach the throttling limit.

## 1.6. Read only fields

All the fields ending in \_extra\_info (assigned\_to\_extra\_info, is\_private\_extra\_info, owner\_extra\_info, project\_extra\_info, status\_extra\_info, status\_extra\_info, user\_story\_extra\_info...) are read only fields

# 2. Endpoints Summary

## 2.1. Auth

URL	Method	Functionality
/api/v1/auth	POST	<a href="#">Login</a>
/api/v1/auth/register	POST	<a href="#">Register user</a>

## 2.2. Applications

URL	Method	Functionality
/api/v1/applications/{applicationId}	GET	<a href="#">Get application</a>
/api/v1/applications/{applicationId}/token	GET	<a href="#">Get application token</a>

## 2.3. Application Tokens

URL	Method	Functionality
/api/v1/application-tokens	GET	<a href="#">List application tokens</a>
/api/v1/application-tokens/{applicationTokenId}	GET	<a href="#">Get application token</a>

URL	Method	Functionality
/api/v1/application-tokens/{applicationTokenId}	DELETE	Delete application token
/api/v1/application-tokens/authorize	POST	Authorize application token
/api/v1/application-tokens/validate	POST	Validate application token

## 2.4. Resolver

URL	Method	Functionality
/api/v1/resolver	GET	Resolve references and slugs

## 2.5. Searches

URL	Method	Functionality
/api/v1/search	GET	Search in a project

## 2.6. User storage

URL	Method	Functionality
/api/v1/user-storage	GET	List user storage data
/api/v1/user-storage	POST	Create user storage data
/api/v1/user-storage/{key}	GET	Get user storage data
/api/v1/user-storage/{key}	PUT	Modify user storage data
/api/v1/user-storage/{key}	PATCH	Modify partially an user storage data
/api/v1/user-storage/{key}	DELETE	Delete user storage data

## 2.7. Project templates

URL	Method	Functionality
/api/v1/project-templates	GET	List project templates
/api/v1/project-templates	POST	Create project template

URL	Method	Functionality
/api/v1/project-templates/{projectTemplateId}	GET	Get project template
/api/v1/project-templates/{projectTemplateId}	PUT	Modify project template
/api/v1/project-templates/{projectTemplateId}	PATCH	Modify partially an project template
/api/v1/project-templates/{projectTemplateId}	DELETE	Delete an project template

## 2.8. Projects

URL	Method	Functionality
/api/v1/projects	GET	List projects
/api/v1/projects	POST	Create project
/api/v1/projects/{projectId}	GET	Get project
/api/v1/projects/by_slug?slug={projectSlug}	GET	Get project
/api/v1/projects/{projectId}	PUT	Modify project
/api/v1/projects/{projectId}	PATCH	Modify partially a project
/api/v1/projects/{projectId}	DELETE	Delete a project
/api/v1/projects/bulk_update_order	POST	Update projects order for logged in user
/api/v1/projects/{projectId}/modules	GET	Get project modules configuration
/api/v1/projects/{projectId}/modules	PATCH	Modify partially a project modules configuration
/api/v1/projects/{projectId}/stats	GET	Get project stats
/api/v1/projects/{projectId}/issues_stats	GET	Get project issue stats
/api/v1/projects/{projectId}/tags_colors	GET	Get project tags colors
/api/v1/projects/{projectId}/create_tag	POST	Create project tag

URL	Method	Functionality
/api/v1/projects/{projectId}/edit_tag	POST	Edit project tag
/api/v1/projects/{projectId}/delete_tag	POST	Delete project tag
/api/v1/projects/{projectId}/mix_tags	POST	Mix project tags
/api/v1/projects/{projectId}/like	POST	Like a project
/api/v1/projects/{projectId}/unlike	POST	Unlike a project
/api/v1/projects/{projectId}/fans	GET	Get project fans
/api/v1/projects/{projectId}/watch	POST	Watch a project
/api/v1/projects/{projectId}/unwatch	POST	Unwatch a project
/api/v1/projects/{projectId}/watchers	GET	Get project watchers
/api/v1/projects/{projectId}/create_template	POST	Create project template
/api/v1/projects/{projectId}/leave	POST	Leave project
/api/v1/projects/{projectId}/change_logo	POST	Change logo
/api/v1/projects/{projectId}/remove_logo	POST	Remove logo
/api/v1/projects/{projectId}/transfer_validate_token	POST	Transfer validate token
/api/v1/projects/{projectId}/transfer_request	POST	Transfer request
/api/v1/projects/{projectId}/transfer_start	POST	Transfer start
/api/v1/projects/{projectId}/transfer_accept	POST	Transfer accept
/api/v1/projects/{projectId}/transfer_reject	POST	Transfer reject

## 2.9. Memberships/Invitations

URL	Method	Functionality
/api/v1/memberships	GET	List memberships
/api/v1/memberships	POST	Create membership
/api/v1/memberships/bulk_create	POST	Create a bulk of memberships
/api/v1/memberships/{membershipId}	GET	Get membership
/api/v1/memberships/{membershipId}	PUT	Modify membership
/api/v1/memberships/{membershipId}	PATCH	Modify partially a membership
/api/v1/memberships/{membershipId}	DELETE	Delete a membership
/api/v1/memberships/{membershipId}/resend_invitation	POST	Resend invitation
/api/v1/invitations/{invitationUuid}	POST	Get invitation by anonymous user

## 2.10. Milestones

URL	Method	Functionality
/api/v1/milestones	GET	List milestones
/api/v1/milestones	POST	Create milestone
/api/v1/milestones/{milestoneId}	GET	Get milestone
/api/v1/milestones/{milestoneId}	PUT	Modify milestone
/api/v1/milestones/{milestoneId}	PATCH	Modify partially a milestone
/api/v1/milestones/{milestoneId}	DELETE	Delete a milestone
/api/v1/milestones/{milestoneId}/stats	GET	Get a milestone stats
/api/v1/milestones/{milestoneId}/watch	POST	Watch a milestone
/api/v1/milestones/{milestoneId}/unwatch	POST	Stop watching a milestone

URL	Method	Functionality
/api/v1/milestones/{milestoneId}/watchers	GET	Get milestone watchers

## 2.11. Epics

URL	Method	Functionality
/api/v1/epics	GET	List epics
/api/v1/epics	POST	Create epic
/api/v1/epics/{epicId}	GET	Get epic
/api/v1/epics/by_ref?ref={epicRef}&project={projectId}	GET	Get epic
/api/v1/epics/{epicId}	PUT	Modify epic
/api/v1/epics/{epicId}	PATCH	Modify partially an epic
/api/v1/epics/{epicId}	DELETE	Delete an epic
/api/v1/epics/{epicId}/related_userstories	GET	List epic related userstories
/api/v1/epics/{epicId}/related_userstories	POST	Create epic related user story
/api/v1/epics/{epicId}/related_userstories/{userStoryId}	GET	Get epic related userstory
/api/v1/epics/{epicId}/related_userstories/{userStoryId}	PUT	Modify epic related user story
/api/v1/epics/{epicId}/related_userstories/{userStoryId}	PATCH	Modify partially an epic related user story
/api/v1/epics/{epicId}/related_userstories/{userStoryId}	DELETE	Delete an epic related user story
/api/v1/epics/{epicId}/related_userstories/bulk_create	POST	Create epic related user stories on bulk mode
/api/v1/epics/bulk_create	POST	Create epics on bulk mode
/api/v1/epics/filters_data?project={projectId}	GET	Get filters data
/api/v1/epics/{epicId}/upvote	POST	Add star to an epic
/api/v1/epics/{epicId}/downvote	POST	Remove star from epic
/api/v1/epics/{epicId}/voters	GET	Get epic voters

URL	Method	Functionality
/api/v1/epics/{epicId}/watch	POST	Watch an epic
/api/v1/epics/{epicId}/unwatch	POST	Unwatch an epic
/api/v1/epics/{epicId}/watchers	GET	Get epic watchers
/api/v1/epics/attachments	GET	List epic attachments
/api/v1/epics/attachments	POST	Create epic attachments
/api/v1/epics/attachments/{epicAttachmentId}	GET	Get epic attachments
/api/v1/epics/attachments/{epicAttachmentId}	PUT	Modify epic attachments
/api/v1/epics/attachments/{epicAttachmentId}	PATCH	Modify partially an epic attachments
/api/v1/epics/attachments/{epicAttachmentId}	DELETE	Delete an epic attachments

## 2.12. Epic status

URL	Method	Functionality
/api/v1/epic-statuses	GET	List epic statuses
/api/v1/epic-statuses	POST	Create epic status
/api/v1/epic-statuses/{epicStatusId}	GET	Get epic status
/api/v1/epic-statuses/{epicStatusId}	PUT	Modify epic status
/api/v1/epic-statuses/{epicStatusId}	PATCH	Modify partially an epic status
/api/v1/epic-statuses/{epicStatusId}	DELETE	Delete an epic status
/api/v1/epic-statuses/bulk_update_order	POST	Update epic statuses order in bulk mode

## 2.13. Epic custom attribute

URL	Method	Functionality
/api/v1/epic-custom-attributes	GET	List epic custom attributes

URL	Method	Functionality
/api/v1/epic-custom-attributes	POST	Create epic custom attribute
/api/v1/epic-custom-attributes/{epicCustomAttributeId}	GET	Get epic custom attribute
/api/v1/epic-custom-attributes/{epicCustomAttributeId}	PUT	Modify epic custom attribute
/api/v1/epic-custom-attributes/{epicCustomAttributeId}	PATCH	Modify partially an epic custom attribute
/api/v1/epic-custom-attributes/{epicCustomAttributeId}	DELETE	Delete an epic custom attribute
/api/v1/epic-custom-attributes/bulk_update_order	POST	Update epic custom attributes order in bulk mode

## 2.14. Epic custom attributes values

URL	Method	Functionality
/api/v1/epics/custom-attributes-values/{epicId}	GET	Get epic custom attributes values
/api/v1/epics/custom-attributes-values/{epicId}	PUT	Modify epic custom attributes values
/api/v1/epics/custom-attributes-values/{epicId}	PATCH	Modify partially an epic custom attributes values

## 2.15. User stories

URL	Method	Functionality
/api/v1/userstories	GET	List user stories
/api/v1/userstories	POST	Create user story
/api/v1/userstories/{userStoryId}	GET	Get user story
/api/v1/userstories/by_ref?ref={userStoryRef}&project={userStoryId}	GET	Get user story
/api/v1/userstories/{userStoryId}	PUT	Modify user story

URL	Method	Functionality
/api/v1/userstories/{userStoryId}	PATCH	Modify partially a user story
/api/v1/userstories/{userStoryId}	DELETE	Delete a user story
/api/v1/userstories/bulk_create	POST	Create user stories un bulk mode
/api/v1/userstories/bulk_update_backlog_order	POST	Update user stories order for backlog in bulk mode
/api/v1/userstories/bulk_update_kanban_order	POST	Update user stories order for kanban in bulk mode
/api/v1/userstories/bulk_update_sprint_order	POST	Update user stories order for sprint in bulk mode
/api/v1/userstories/bulk_update_milestone	POST	Update user stories sprint in bulk mode
/api/v1/userstories/filters_data?project={projectId}	GET	Get filters data
/api/v1/userstories/{userStoryId}/upvote	POST	Add star to a user story
/api/v1/userstories/{userStoryId}/downvote	POST	Remove star from user story
/api/v1/userstories/{userStoryId}/voters	GET	Get user story voters
/api/v1/userstories/{userStoryId}/watch	POST	Watch a user story
/api/v1/userstories/{userStoryId}/unwatch	POST	Unwatch a user story
/api/v1/userstories/{userStoryId}/watchers	GET	Get user story watchers
/api/v1/userstories/attachments	GET	List user story attachments
/api/v1/userstories/attachments	POST	Create user story attachments
/api/v1/userstories/attachments/{userStoryAttachmentId}	GET	Get user story attachments
/api/v1/userstories/attachments/{userStoryAttachmentId}	PUT	Modify user story attachments
/api/v1/userstories/attachments/{userStoryAttachmentId}	PATCH	Modify partially a user story attachments
/api/v1/userstories/attachments/{userStoryAttachmentId}	DELETE	Delete a user story attachments

## 2.16. User story status

URL	Method	Functionality
/api/v1/userstory-statuses	GET	List user story status
/api/v1/userstory-statuses	POST	Create user story status
/api/v1/userstory-statuses/{userStoryStatusId}	GET	Get user story status
/api/v1/userstory-statuses/{userStoryStatusId}	PUT	Modify user story status
/api/v1/userstory-statuses/{userStoryStatusId}	PATCH	Modify partially a user story status
/api/v1/userstory-statuses/{userStoryStatusId}	DELETE	Delete a user story status
/api/v1/userstory-statuses/bulk_update_order	POST	Update user story statuses order in bulk mode

## 2.17. Points

URL	Method	Functionality
/api/v1/points	GET	List points
/api/v1/points	POST	Create point
/api/v1/points/{pointId}	GET	Get point
/api/v1/points/{pointId}	PUT	Modify point
/api/v1/points/{pointId}	PATCH	Modify partially a point
/api/v1/points/{pointId}	DELETE	Delete a point
/api/v1/points/bulk_update_order	POST	Update points order in bulk mode

## 2.18. User story custom attribute

URL	Method	Functionality
/api/v1/userstory-custom-attributes	GET	List user story custom attributes
/api/v1/userstory-custom-attributes	POST	Create user story custom attribute

URL	Method	Functionality
/api/v1/userstory-custom-attributes/{userStoryCustomAttributeId}	GET	Get user story custom attribute
/api/v1/userstory-custom-attributes/{userStoryCustomAttributeId}	PUT	Modify user story custom attribute
/api/v1/userstory-custom-attributes/{userStoryCustomAttributeId}	PATCH	Modify partially a user story custom attribute
/api/v1/userstory-custom-attributes/{userStoryCustomAttributeId}	DELETE	Delete a user story custom attribute
/api/v1/userstory-custom-attributes/bulk_update_order	POST	Update user story custom attributes order in bulk mode

## 2.19. User story custom attributes values

URL	Method	Functionality
/api/v1/userstories/custom-attributes-values/{userStoryId}	GET	Get user story custom attributes values
/api/v1/userstories/custom-attributes-values/{userStoryId}	PUT	Modify user story custom attributes values
/api/v1/userstories/custom-attributes-values/{userStoryId}	PATCH	Modify partially a user story custom attributes values

## 2.20. Tasks

URL	Method	Functionality
/api/v1/tasks	GET	List tasks
/api/v1/tasks	POST	Create task
/api/v1/tasks/{taskId}	GET	Get task
/api/v1/tasks/by_ref?ref={taskRef}&project={projectId}	GET	Get task
/api/v1/tasks/{taskId}	PUT	Modify task
/api/v1/tasks/{taskId}	PATCH	Modify partially a task

URL	Method	Functionality
/api/v1/tasks/{taskId}	DELETE	Delete a task
/api/v1/tasks/bulk_create	POST	Create tasks on bulk mode
/api/v1/tasks/filters_data?project={projectId}	GET	Get filters data
/api/v1/tasks/{taskId}/upvote	POST	Add star to a task
/api/v1/tasks/{taskId}/downvote	POST	Remove star from task
/api/v1/tasks/{taskId}/voters	GET	Get task voters
/api/v1/tasks/{taskId}/watch	POST	Watch a task
/api/v1/tasks/{taskId}/unwatch	POST	Unwatch a task
/api/v1/tasks/{taskId}/watchers	GET	Get task watchers
/api/v1/tasks/attachments	GET	List task attachments
/api/v1/tasks/attachments	POST	Create task attachments
/api/v1/tasks/attachments/{taskAttachmentId}	GET	Get task attachments
/api/v1/tasks/attachments/{taskAttachmentId}	PUT	Modify task attachments
/api/v1/tasks/attachments/{taskAttachmentId}	PATCH	Modify partially a task attachments
/api/v1/tasks/attachments/{taskAttachmentId}	DELETE	Delete a task attachments

## 2.21. Task status

URL	Method	Functionality
/api/v1/task-statuses	GET	List task statuses
/api/v1/task-statuses	POST	Create task status
/api/v1/task-statuses/{taskStatusId}	GET	Get task status
/api/v1/task-statuses/{taskStatusId}	PUT	Modify task status
/api/v1/task-statuses/{taskStatusId}	PATCH	Modify partially a task status

URL	Method	Functionality
/api/v1/task-statuses/{taskStatusId}	DELETE	Delete a task status
/api/v1/task-statuses/bulk_update_order	POST	Update task statuses order in bulk mode

## 2.22. Task custom attribute

URL	Method	Functionality
/api/v1/task-custom-attributes	GET	List task custom attributes
/api/v1/task-custom-attributes	POST	Create task custom attribute
/api/v1/task-custom-attributes/{taskCustomAttributeId}	GET	Get task custom attribute
/api/v1/task-custom-attributes/{taskCustomAttributeId}	PUT	Modify task custom attribute
/api/v1/task-custom-attributes/{taskCustomAttributeId}	PATCH	Modify partially a task custom attribute
/api/v1/task-custom-attributes/{taskCustomAttributeId}	DELETE	Delete a task custom attribute
/api/v1/task-custom-attributes/bulk_update_order	POST	Update task custom attributes order in bulk mode

## 2.23. Task custom attributes values

URL	Method	Functionality
/api/v1/tasks/custom-attributes-values/{taskId}	GET	Get task custom attributes values
/api/v1/tasks/custom-attributes-values/{taskId}	PUT	Modify task custom attributes values
/api/v1/tasks/custom-attributes-values/{taskId}	PATCH	Modify partially a task custom attributes values

## 2.24. Issues

URL	Method	Functionality
/api/v1/issues	GET	List issues
/api/v1/issues	POST	Create issue
/api/v1/issues/{issueId}	GET	Get issue
/api/v1/issues/by_ref?ref={issueRef}&project={projectId}	GET	Get issue
/api/v1/issues/{issueId}	PUT	Modify issue
/api/v1/issues/{issueId}	PATCH	Modify partially an issue
/api/v1/issues/{issueId}	DELETE	Delete an issue
/api/v1/issues/bulk_create	POST	Create issues un bulk mode
/api/v1/issues/filters_data?project={projectId}	GET	Get filters data
/api/v1/issues/{issueId}/upvote	POST	Add a vote to an issue
/api/v1/issues/{issueId}/downvote	POST	Remove your vote to an issue
/api/v1/issues/{issueId}/voters	GET	Get issue voters list
/api/v1/issues/{issueId}/watch	POST	Watch an issue
/api/v1/issues/{issueId}/unwatch	POST	Unwatch an issue
/api/v1/issues/{issueId}/watchers	GET	Get issue watchers
/api/v1/issues/attachments	GET	List issue attachments
/api/v1/issues/attachments	POST	Create issue attachments
/api/v1/issues/attachments/{issueAttachmentId}	GET	Get issue attachments
/api/v1/issues/attachments/{issueAttachmentId}	PUT	Modify issue attachments
/api/v1/issues/attachments/{issueAttachmentId}	PATCH	Modify partially an issue attachments
/api/v1/issues/attachments/{issueAttachmentId}	DELETE	Delete an issue attachments

## 2.25. Issue status

URL	Method	Functionality
/api/v1/issue-statuses	GET	List issue statuses
/api/v1/issue-statuses	POST	Create issue status
/api/v1/issue-statuses/{issueStatusId}	GET	Get issue status
/api/v1/issue-statuses/{issueStatusId}	PUT	Modify issue status
/api/v1/issue-statuses/{issueStatusId}	PATCH	Modify partially a issue status
/api/v1/issue-statuses/{issueStatusId}	DELETE	Delete a issue status
/api/v1/issue-statuses/bulk_update_order	POST	Update issue statuses order in bulk mode

## 2.26. Issue types

URL	Method	Functionality
/api/v1/issue-types	GET	List issue types
/api/v1/issue-types	POST	Create issue type
/api/v1/issue-types/{issueTypeId}	GET	Get issue type
/api/v1/issue-types/{issueTypeId}	PUT	Modify issue type
/api/v1/issue-types/{issueTypeId}	PATCH	Modify partially a issue type
/api/v1/issue-types/{issueTypeId}	DELETE	Delete a issue type
/api/v1/issue-types/bulk_update_order	POST	Update issue types order in bulk mode

## 2.27. Priorities

URL	Method	Functionality
/api/v1/priorities	GET	List priorities
/api/v1/priorities	POST	Create priority
/api/v1/priorities/{priorityId}	GET	Get priority

URL	Method	Functionality
/api/v1/priorities/{priorityId}	PUT	Modify priority
/api/v1/priorities/{priorityId}	PATCH	Modify partially a priority
/api/v1/priorities/{priorityId}	DELETE	Delete a priority
/api/v1/priorities/bulk_update_order	POST	Update priorities order in bulk mode

## 2.28. Severities

URL	Method	Functionality
/api/v1/severities	GET	List severities
/api/v1/severities	POST	Create severity
/api/v1/severities/{severityId}	GET	Get severity
/api/v1/severities/{severityId}	PUT	Modify severity
/api/v1/severities/{severityId}	PATCH	Modify partially a severity
/api/v1/severities/{severityId}	DELETE	Delete a severity
/api/v1/severities/bulk_update_order	POST	Update severities order in bulk mode

## 2.29. Issue custom attribute

URL	Method	Functionality
/api/v1/issue-custom-attributes	GET	List issue custom attributes
/api/v1/issue-custom-attributes	POST	Create issue custom attribute
/api/v1/issue-custom-attributes/{issueCustomAttributeId}	GET	Get issue custom attribute
/api/v1/issue-custom-attributes/{issueCustomAttributeId}	PUT	Modify issue custom attribute
/api/v1/issue-custom-attributes/{issueCustomAttributeId}	PATCH	Modify partially a issue custom attribute

URL	Method	Functionality
/api/v1/issue-custom-attributes/{issueCustomAttributeId}	DELETE	Delete a issue custom attribute
/api/v1/issue-custom-attributes/bulk_update_order	POST	Update issue custom attributes order in bulk mode

## 2.30. Issue custom attributes values

URL	Method	Functionality
/api/v1/issues/custom-attributes-values/{issueId}	GET	Get issue custom attributes values
/api/v1/issues/custom-attributes-values/{issueId}	PUT	Modify issue custom attributes values
/api/v1/issues/custom-attributes-values/{issueId}	PATCH	Modify partially a issue custom attributes values

## 2.31. Wiki pages

URL	Method	Functionality
/api/v1/wiki	GET	List wiki pages
/api/v1/wiki	POST	Create wiki page
/api/v1/wiki/{wikiId}	GET	Get wiki page
/api/v1/wiki/by_slug?slug={wikiPageSlug}&project={projectId}	GET	Get wiki page
/api/v1/wiki/{wikiPageId}	PUT	Modify wiki page
/api/v1/wiki/{wikiPageId}	PATCH	Modify partially an wiki page
/api/v1/wiki/{wikiPageId}	DELETE	Delete an wiki page
/api/v1/wiki/{wikiPageId}/watch	POST	Watch a wiki page
/api/v1/wiki/{wikiPageId}/unwatch	POST	Stop watching a wiki page
/api/v1/wiki/{wikiPageId}/watchers	GET	Get wiki page watchers
/api/v1/wiki/attachments	GET	List wiki page attachments
/api/v1/wiki/attachments	POST	Create wiki page attachments

URL	Method	Functionality
/api/v1/wiki/attachments/{wikiPageAttachmentId}	GET	Get wiki page attachments
/api/v1/wiki/attachments/{wikiPageAttachmentId}	PUT	Modify wiki page attachments
/api/v1/wiki/attachments/{wikiPageAttachmentId}	PATCH	Modify partially an wiki page attachments
/api/v1/wiki/attachments/{wikiPageAttachmentId}	DELETE	Delete an wiki page attachments

## 2.32. Wiki links

URL	Method	Functionality
/api/v1/wiki-links	GET	List wiki links
/api/v1/wiki-links	POST	Create wiki link
/api/v1/wiki-links/{wikiLinkId}	GET	Get wiki link
/api/v1/wiki-links/{wikiLinkId}	PUT	Modify wiki link
/api/v1/wiki-links/{wikiLinkId}	PATCH	Modify partially an wiki link
/api/v1/wiki-links/{wikiLinkId}	DELETE	Delete an wiki link

## 2.33. History

URL	Method	Functionality
/api/v1/history/userstory/{usId}	GET	Get user story history
/api/v1/history/userstory/{usId}/commentVersions?id={commentId}	GET	Get user story comment versions
/api/v1/history/userstory/{usId}/edit_comment?id={commentId}	POST	Edit user story comment
/api/v1/history/userstory/{usId}/delete_comment?id={commentId}	POST	Delete user story comment
/api/v1/history/userstory/{usId}/undelete_comment?id={commentId}	POST	Undelete user story comment
/api/v1/history/issue/{issueId}	GET	Get issue history

URL	Method	Functionality
/api/v1/history/issue/{issueId}/commentVersions?id={commentId}	POST	Get issue comment versions
/api/v1/history/issue/{issueId}/edit_comment?id={commentId}	POST	Edit issue comment
/api/v1/history/issue/{issueId}/delete_comment?id={commentId}	POST	Delete issue comment
/api/v1/history/issue/{issueId}/undelete_comment?id={commentId}	POST	Undelete issue comment
/api/v1/history/task/<taskId>	GET	Get task history
/api/v1/history/task/{taskId}/commentVersions?id={commentId}	POST	Get task comment versions
/api/v1/history/task/{taskId}/edit_comment?id={commentId}	POST	Edit task comment
/api/v1/history/task/{taskId}/delete_comment?id={commentId}	POST	Delete task comment
/api/v1/history/task/{taskId}/undelete_comment?id={commentId}	POST	Undelete task comment
/api/v1/history/wiki/{wikiId}	GET	Get wiki history
/api/v1/history/wiki/{wikiId}/commentVersions?id={commentId}	POST	Get wiki comment versions
/api/v1/history/wiki/{wikiId}/edit_comment?id={commentId}	POST	Edit wiki comment
/api/v1/history/wiki/{wikiId}/delete_comment?id={commentId}	POST	Delete wiki comment
/api/v1/history/wiki/{wikiId}/undelete_comment?id={commentId}	POST	Undelete wiki comment

## 2.34. Users

URL	Method	Functionality
/api/v1/users	GET	List users
/api/v1/users/{userId}	GET	Get user

URL	Method	Functionality
/api/v1/users/me	GET	Get myself
/api/v1/users/{userId}	PUT	Modify user
/api/v1/users/{userId}	PATCH	Modify partially a user
/api/v1/users/{userId}/stats	GET	Get user stats
/api/v1/users/{userId}/watched	GET	Get user watched content
/api/v1/users/{userId}/liked	GET	Get user liked content
/api/v1/users/{userId}/voted	GET	Get user voted content
/api/v1/users/{userId}	DELETE	Delete a user
/api/v1/users/{userId}/contacts	GET	Get user contacts
/api/v1/users/cancel	POST	Cancel user
/api/v1/users/change_avatar	POST	Change avatar
/api/v1/users/remove_avatar	POST	Remove avatar
/api/v1/users/change_email	POST	Change email
/api/v1/users/change_password	POST	Change password
/api/v1/users/password_recovery	POST	Password recovery
/api/v1/users/change_password_from_recovery	POST	Change password from recovery

## 2.35. Notify policies

URL	Method	Functionality
/api/v1/notify-policies	GET	List notify policies
/api/v1/notify-policies/{policyId}	GET	Get notify policy
/api/v1/notify-policies/{policyId}	PUT	Modify notify policy
/api/v1/notify-policies/{policyId}	PATCH	Modify partially a notify policy

## 2.36. Feedback

URL	Method	Functionality
/api/v1/feedback	POST	Send feedback

## 2.37. Export/Import

URL	Method	Functionality
/api/v1/exporter/{projectId}	GET	Export a project dump
/api/v1/importer/load_dump	POST	Import a project dump

## 2.38. Webhooks

URL	Method	Functionality
/api/v1/webhooks	GET	List webhooks
/api/v1/webhooks	POST	Create webhook
/api/v1/webhooks/{webhookId}	GET	Get webhook
/api/v1/webhooks/{webhookId}	PUT	Modify webhook
/api/v1/webhooks/{webhookId}	PATCH	Modify partially an webhook
/api/v1/webhooks/{webhookId}	DELETE	Delete an webhook
/api/v1/webhooks/{webhookId}/test	POST	Test webhook
/api/v1/webhooklogs	GET	List webhooks logs
/api/v1/webhooklogs/{webhookLogId}	GET	Get webhook log
/api/v1/webhooklogs/{webhookLogId}/resend	POST	Resend webhook log request

## 2.39. Timelines

URL	Method	Functionality
/api/v1/timeline/user/{userId}	GET	List user timeline
/api/v1/timeline/profile/{userId}	GET	List profile timeline
/api/v1/timeline/project/{projectId}	GET	List project timeline

## 2.40. Locales

URL	Method	Functionality
/api/v1/locales	GET	List locales

## 2.41. Stats

URL	Method	Functionality
/api/v1/stats/discover	GET	Get discover stats
/api/v1/stats/system	GET	Get system stats

## 3. Auth

### 3.1. Normal login

To login a user send a POST request containing the following data:

- **type** with value "normal"
- **username** (required): this field also supports the user email
- **password** (required)

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "password": "password",
    "type": "normal",
    "username": "test-username"
}' \
-s http://localhost:8000/api/v1/auth
```

When the login is successful, the HTTP response is a 200 OK and the response body is a JSON [user auth detail object](#)

### 3.2. Github login

To login a user via GitHub send a POST request containing the following data:

- **type** with value "github"
- **code** (required): your github authentication code
- **token**: generated when creating a project's membership (for accept invitations to projects)

```
curl -X POST \
-H "Content-Type: application/json" \
-d '{
  "type": "github",
  "code": "'${GITHUB_CODE}'"
}' \
https://api.taiga.io/api/v1/auth
```

When the login is successful, the HTTP response is a 200 OK and the response body is a JSON [user auth detail object](#)

*Get GitHub authorized code*

To get the GitHub code you have to follow the first step *Redirect users to request GitHub access* described in [GitHub Documentation for Developers - API - OAuth - Web Application Flow](#).

**NOTE**

Taiga needs privileges to get the user email from Github so you have to use the scope user:email.

### 3.3. Public registry

To register a user without invitation send a POST request containing the following data:

- **type** with value "public"
- **username** (required)
- **password** (required)
- **email** (required)
- **full\_name** (required)

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "email": "test-register2@email.com",
  "full_name": "test",
  "password": "password",
  "type": "public",
  "username": "test-username2"
}' \
-s http://localhost:8000/api/v1/auth/register
```

When the registration is successful, the HTTP response is a 201 CREATED and the response body is a

## 3.4. Private registry

To add a user into a project via invitation send a POST request containing the following data:

- **type** with value "private"
- **existing** (required): indicates if the user is member or not
- **token** (required): generated when creating a project's membership
- **username** (required)
- **password** (required)
- **email** (required only if the user doesn't exist in the platform)
- **full\_name** (required only if the user doesn't exist in the platform)

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "email": "test-register@email.com",
  "existing": false,
  "full_name": "test",
  "password": "password",
  "token": "00000000-0000-0000-0000-000000000000",
  "type": "private",
  "username": "test-username"
}' \
-s http://localhost:8000/api/v1/auth/register
```

When the registration is successful, the HTTP response is a 201 CREATED and the response body is a JSON [user auth detail object](#)

## 4. Applications

### 4.1. Get

To get an application send a GET request specifying the application id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/applications/00000000-0000-0000-0000-000000000000
```

The HTTP response is a 200 OK and the response body is a JSON [application object](#)

## 4.2. Get token

To get an application token send a GET request specifying the application id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/applications/00000000-0000-0000-0000-000000000000/token
```

The HTTP response is a 200 OK and the response body is a JSON [application token object](#)

# 5. Application tokens

## 5.1. List

To list the application tokens for an authenticated user send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/application-tokens
```

The HTTP response is a 200 OK and the response body is a JSON list of [application token objects](#)

## 5.2. Get

To get an application token send a GET request specifying the application token id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/application-tokens/1
```

The HTTP response is a 200 OK and the response body is a JSON [application token object](#)

## 5.3. Delete

To delete application tokens send a DELETE specifying the application token id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/application-tokens/2
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 5.4. Authorize

To request an authorization code send a POST request with the following data:

- **application**: the application id for the requested token
- **state**: an unguessable random string. It is used to protect against cross-site request forgery attacks. The API will include this value when the validation process is completed so the final app can verify it matches the original one.

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "application": "00000000-0000-0000-0000-000000000000",  
    "state": "random-state"  
}' \  
-s http://localhost:8000/api/v1/application-tokens/authorize
```

When the creation is successful, the HTTP response is a 200 and the response body is a JSON [authorization code object](#)

## 5.5. Validate

To validate an authorization code send a POST request with the following data:

- **application**: the application id for the requested token
- **state**: an unguessable random string. It is used to protect against cross-site request forgery attacks. The API will include this value when the validation process is completed so the final app can verify it matches the original one.
- **auth\_code**: the authorization code received on previous the steps.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "application": "00000000-0000-0000-0000-000000000000",
    "auth_code": "00000000-0000-0000-0000-000000000002",
    "state": "random-state"
}' \
-s http://localhost:8000/api/v1/application-tokens/validate
```

When the creation is successful, the HTTP response is a 200 and the response body is a JSON [cyphered token object](#)

## 6. Resolver

### 6.1. Projects

To resolve the id of a project send a GET request with the following parameters:

- **project** (required): the project slug trying to be resolved

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/resolver?project=project-0
```

The response body is a JSON object containing the project id

```
{
  "project": 1
}
```

## 6.2. User stories

To resolve the id of a user story send a GET request with the following parameters:

- **project** (required): the project slug trying to be resolved
- **us** (required): the user story ref trying to be resolved

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/resolver?project=project-0&us=1
```

The response body is a JSON object containing the project and the user story ids

```
{  
  "project": 1,  
  "us": 1  
}
```

## 6.3. Issues

To resolve the id of an issue send a GET request with the following parameters:

- **project** (required): the project slug trying to be resolved
- **issue** (required): the issue ref trying to be resolved

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/resolver?project=project-0&issue=119
```

The response body is a JSON object containing the project and the issue ids

```
{  
  "issue": 23,  
  "project": 1  
}
```

## 6.4. Tasks

To resolve the id of a task send a GET request with the following parameters:

- **project** (required): the project slug trying to be resolved
- **task** (required): the task ref trying to be resolved

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/resolver?project=project-0&task=2
```

The response body is a JSON object containing the project and the task ids

```
{  
  "project": 1,  
  "task": 1  
}
```

## 6.5. Milestones

To resolve the id of a milestone send a GET request with the following parameters:

- **project** (required): the project slug trying to be resolved
- **milestone** (required): the milestone slug trying to be resolved

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/resolver?project=project-0&milestone=sprint-2016-8-20
```

The response body is a JSON object containing the project and the milestone ids

```
{  
  "milestone": 1,  
  "project": 1  
}
```

## 6.6. Wiki pages

To resolve the id of a wiki page send a GET request with the following parameters:

- **project** (required): the project slug trying to be resolved
- **wikipage**(required): the wiki-page slug trying to be resolved

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/resolver?project=project-0&wikipage=home
```

The response body is a JSON object containing the project and the wiki page ids

```
{  
  "project": 1,  
  "wikipage": 1  
}
```

## 6.7. Multiple resolution

To resolve the multiple ids you can send a GET mixing parameters from the previous examples:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/resolver?project=project-0&task=2&us=1&wikipage=home
```

The response body is a JSON object containing the project and the task ids

```
{  
  "project": 1,  
  "task": 1,  
  "us": 1,  
  "wikipage": 1  
}
```

## 6.8. By ref value

To resolve an object if we don't know its type we have to use **ref** GET parameter:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/resolver?project=project-0&ref=2
```

The response body is a JSON object containing the project and the story, task or issue id.

```
{  
  "project": 1,  
  "task": 1  
}
```

*Incompatibility between GET params*

**IMPORTANT** Be careful because `ref` is incompatible with `us`, `task` and `issue` parameters in requests with multiple resolutions.

## 7. Searches

### 7.1. Search

To search send a GET request with the following get parameters:

- **project** (required): project id
- **text**: string

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/search?project=1&text=quas
```

The HTTP response is a 200 OK and the response body is a JSON list of `search results detail objects`

## 8. User storage

### 8.1. List

To list user storage data send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/user-storage
```

The HTTP response is a 200 OK and the response body is a JSON list of [user storage data objects](#)

## 8.2. Create

To create user storage data send a POST request with the following data:

- **key**: string
- **value**: string

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "key": "favorite-forest",  
    "value": "Taiga"  
}' \  
-s http://localhost:8000/api/v1/user-storage
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [user storage data object](#)

## 8.3. Get

To get a user storage data send a GET request specifying the user storage key in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/user-storage/favorite-forest
```

The HTTP response is a 200 OK and the response body is a JSON [user storage data object](#)

## 8.4. Edit

To edit user storage data send a PUT or a PATCH specifying the user storage key in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "value": "Russian Taiga"  
}' \  
-s http://localhost:8000/api/v1/user-storage/favorite-forest
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [user storage data object](#)

## 8.5. Delete

To delete user storage data send a DELETE specifying the user storage key in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/user-storage/favorite-forest
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

# 9. Project templates

## 9.1. List

To list project templates send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/project-templates
```

The HTTP response is a 200 OK and the response body is a JSON list of [project template detail objects](#)

## 9.2. Create

To create project templates send a POST request with the following data:

- **name** (required): string

- **slug**: slug
- **description** (required): string
- **default\_owner\_role** (required):
- **is\_backlog\_activated**: boolean
- **is\_kanban\_activated**: boolean
- **is\_wiki\_activated**: boolean
- **is\_issues\_activated**: boolean
- **videoconferences**: (talky | appear-in)
- **videoconferences\_extra\_data**: string
- **default\_options**: a json with a list of objects with:
  - **points**: slug
  - **us\_status**: slug
  - **task\_status**: slug
  - **issue\_status**: slug
  - **issue\_type**: slug
  - **priority**: slug
  - **severity**: slug
- **us\_statuses**: a json with a list of objects with:
  - **name**: string
  - **slug**: slug
  - **is\_closed**: boolean
  - **color**: #rgb color
  - **wip\_limit**: integer or none
  - **order**: integer
- **points**: a json with a list of objects with:
  - **name**: string
  - **value**: integer or none
  - **order**: integer
- **task\_statuses**: a json with a list of objects with:
  - **name**: string
  - **slug**: slug

- **is\_closed**: boolean
- **color**: #rgb color
- **order**: integer
- **issue\_statuses**: a json with a list of objects with:
  - **name**: string
  - **slug**: slug
  - **is\_closed**: boolean
  - **color**: #rgb color
  - **order**: integer
- **issue\_types**: a json with a list of objects with:
  - **name**: string
  - **color**: #rgb color
  - **order**: integer
- **priorities**: a json with a list of objects with:
  - **name**: string
  - **color**: #rgb color
  - **order**: integer
- **severities**: a json with a list of objects with:
  - **name**: string
  - **color**: #rgb color
  - **order**: integer
- **roles**: a json with a list of objects with:
  - **name**: string
  - **slug**: slug
  - **permissions**: list of permissions
  - **order**: integer
  - **computable**: boolean

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${ADMIN_AUTH_TOKEN}" \
-d '{
```

```
"default_options": {
    "issue_status": "New",
    "issue_type": "Bug",
    "points": "?",
    "priority": "Normal",
    "severity": "Normal",
    "task_status": "New",
    "us_status": "New"
},
"default_owner_role": "product-owner",
"description": "Sample description",
"id": 2,
"is_backlog_activated": false,
"is_issues_activated": false,

        "wip_limit": null
    }
],
"videoconferences": null,
"videoconferences_extra_data": ""
}' \
-s http://localhost:8000/api/v1/project-templates

```

```

curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${ADMIN_AUTH_TOKEN}" \
-d '{
    "default_owner_role": "product-owner",
    "description": "Sample description",
    "name": "New simple template"
}' \
-s http://localhost:8000/api/v1/project-templates

```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON project template detail object

## 9.3. Get

To get a project template send a GET request specifying the project template id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/project-templates/1
```

The HTTP response is a 200 OK and the response body is a JSON [project template detail object](#)

## 9.4. Edit

To edit project templates send a PUT or a PATCH specifying the project template id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${ADMIN_AUTH_TOKEN}" \
-d '{
    "description": "New description"
}' \
-s http://localhost:8000/api/v1/project-templates/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [project template detail object](#)

## 9.5. Delete

To delete project template send a DELETE specifying the project template id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${ADMIN_AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/project-templates/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

# 10. Projects

## 10.1. List

To list projects send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/projects
```

The HTTP response is a 200 OK and the response body is a JSON list of [project list entry objects](#)

The results can be filtered using the following parameters:

- **member**: member id
- **members**: member ids
- **is\_looking\_for\_people**: the project is looking for new members
- **is\_featured**: the project has been highlighted by the instance staff
- **is\_backlog\_activated**: backlog is active
- **is\_kanban\_activated**: kanban is active

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/projects?member=1
```

The results can be ordered using the `order_by` parameter with the values:

- **memberships\_user\_order**: the project order specified by the user
- **total\_fans**: total fans for the project
- **total\_fans\_last\_week**: number of new fans in the last week
- **total\_fans\_last\_month**: number of new fans in the last month
- **total\_fans\_last\_year**: number of new fans in the last year
- **total\_activity**: number of history entries for the project
- **total\_activity\_last\_week**: number of history entries generated in the last week
- **total\_activity\_last\_month**: number of history entries generated in the last month
- **total\_activity\_last\_year**: number of history entries generated in the last year

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/projects?member=1&order_by=memberships__user_order
```

## 10.2. Create

To create projects send a POST request with the following data:

- **name** (required)
- **description** (required)
- **creation\_template**: base template for the project
- **is\_backlog\_activated**
- **is\_issues\_activated**
- **is\_kanban\_activated**
- **is\_private**
- **is\_wiki\_activated**
- **videoconferences**: appear-in or talky, the third party used for meetups if enabled
- **videoconferences\_extra\_data**: string used for the videoconference chat url generation
- **total\_milestones**
- **total\_story\_points**

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "description": "Beta description",  
    "name": "Beta project"  
}' \  
-s http://localhost:8000/api/v1/projects
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "creation_template": 1,
  "description": "Taiga",
  "is_backlog_activated": false,
  "is_issues_activated": true,
  "is_kanban_activated": true,
  "is_private": false,
  "is_wiki_activated": true,
  "name": "Beta project",
  "total_milestones": 3,
  "total_story_points": 20.0,
  "videoconferences": "appear-in",
  "videoconferences_extra_data": null
}' \
-s http://localhost:8000/api/v1/projects
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [project detail object](#)

## 10.3. Get

To get a project send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1
```

The HTTP response is a 200 OK and the response body is a JSON [project detail object](#)

## 10.4. Get by slug

To get a project send a GET request specifying the project slug as parameter:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/by_slug?slug=project-0
```

The HTTP response is a 200 OK and the response body is a JSON [project detail object](#)

## 10.5. Edit

To edit projects send a PUT or a PATCH specifying the project id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PUT \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "description": "Beta description",
    "name": "Beta project put"
}' \
-s http://localhost:8000/api/v1/projects/1
```

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Beta project patch"
}' \
-s http://localhost:8000/api/v1/projects/1
```

When the edit is successful, the HTTP response is a 200 OK and the response body is a JSON [project detail object](#)

## 10.6. Delete

To delete projects send a DELETE specifying the project id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 10.7. Bulk update order

To update the projects order for the logged in user send a POST request with a json list where each element is a json object with two attributes, the project id and the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '[
  {
    "order": 10,
    "project_id": 1
  },
  {
    "order": 15,
    "project_id": 2
  }
]' \
-s http://localhost:8000/api/v1/projects/bulk_update_order
```

When the update is successful, the HTTP response is a 200 OK and the response body is empty

## 10.8. Get modules configuration

To get a project modules configuration send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/modules
```

The HTTP response is a 200 OK and the response body is a JSON [project modules configuration object](#)

## 10.9. Edit modules configuration

To edit a project modules configuration send a PATCH specifying the project id in the url.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "github": {
    "secret": "new_secret"
  }
}' \
-s http://localhost:8000/api/v1/projects/1/modules
```

When edition succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 10.10. Stats

To get a project stats send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/stats
```

The HTTP response is a 200 OK and the response body is a JSON [project stats object](#)

## 10.11. Issue stats

To get a project issue stats send a GET request specifying the project id in the url

```
{
  "closed_issues": 16,
  "issues_per_assigned_to": {
    "0": {
      "color": "black",
      "count": 8,

        "count": 2,
        "id": 7,
        "name": "Postponed"
    }
}
```

The HTTP response is a 200 OK and the response body is a JSON project issue stats object

## 10.12. Tag colors

To get a project tag colors stats send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/tags colors
```

The HTTP response is a 200 OK and the response body is a JSON project tag colors object

## 10.13. Create tag

To create tags send a POST request specifying the project id in the url with the following data:

- **tag** (required)
- **color**: HEX color

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#FC8EAC",
    "tag": "testing-tag"
}' \
-s http://localhost:8000/api/v1/projects/1/create_tag
```

When the creation is successful, the HTTP response is a 200 OK with an empty body response

## 10.14. Edit tag

To edit a tag send a POST specifying the project id in the url.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#FFF8E7",
    "from_tag": "testing-tag",
    "to_tag": "testing-tag-updated"
}' \
-s http://localhost:8000/api/v1/projects/1/edit_tag
```

When the edit is successful, the HTTP response is a 200 OK with an empty body response

## 10.15. Delete-tag

To delete a tag send a POST specifying the project id in the url.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "tag": "testing-tag-updated"
}' \
-s http://localhost:8000/api/v1/projects/1/delete_tag
```

When the edit is successful, the HTTP response is a 200 OK with an empty body response

## 10.16. Mix tags

To mix tags send a POST specifying the project id in the url.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "from_tags": [
        "modi",
        "eligendi",
        "preferendis",
        "voluptates"
    ],
    "to_tag": "modi"
}' \
-s http://localhost:8000/api/v1/projects/1/mix_tags
```

When the edit is successful, the HTTP response is a 200 OK with an empty body response

## 10.17. Like a project

To like a project send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/like
```

The HTTP response is a 200 OK with an empty body response

## 10.18. Unlike a project

To unlike a project send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/unlike
```

The HTTP response is a 200 OK with an empty body response

## 10.19. List project fans

To get the list of fans from a project send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/fans
```

The HTTP response is a 200 OK and the response body is a JSON list of [project voter](#) object

## 10.20. Watch a project

To watch a project send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "notify_level": 3
}' \
-s http://localhost:8000/api/v1/projects/1/watch
```

The HTTP response is a 200 OK with an empty body response

## 10.21. Stop watching project

To stop watching a project send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 10.22. List project watchers

To get the list of watchers from a project send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/watchers
```

The HTTP response is a 200 OK and the response body is a JSON list of [project watcher object](#)

## 10.23. Create template

To create a template from a selected project send a POST request specifying the project id in the url with the following parameters:

- **name** (required)
- **description** (required)

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${ADMIN_AUTH_TOKEN}" \
-d '{
    "template_description": "Beta template description",
    "template_name": "Beta template"
}' \
-s http://localhost:8000/api/v1/projects/1/create_template
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [project template detail object](#)

## 10.24. Leave

To leave a project send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/3/leave
```

The HTTP response is a 200 OK with an empty body response

## 10.25. Change logo

To change your project logo send a POST with the following data

```
curl -X POST \
-H "Content-Type: multipart/form-data" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-F logo=@test.png \
-s http://localhost:8000/api/v1/projects/1/change_logo
```

When the change is successful, the HTTP response is a 200 OK and the response body is a JSON [project detail object](#)

## 10.26. Remove logo

To remove your project logo send a POST with the following data

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/remove_logo
```

When the change is successful, the HTTP response is a 200 OK and the response body is a JSON [project detail object](#)

## 10.27. Transfer validate-token

To check if a transfer token for one project is valid for your user send a POST request specifying the project id in the url and containing the following data:

- **token**: valid transfer token received by email.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "token": "6:1buyed:Z64dQb1M495E1UczL0atESFKc8E"
}' \
-s http://localhost:8000/api/v1/projects/1/transfer_validate_token
```

The HTTP response is a 200 OK with an empty body response

## 10.28. Transfer request

To request to the owner the transfer of a project send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/projects/1/transfer_request
```

The HTTP response is a 200 OK with an empty body response

## 10.29. Transfer start

To start the transfer of one of your projects to another user send a POST request specifying the project id in the url and containing the following data:

- **user**: user id of other admin member of the project.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "user": 5
}' \
-s http://localhost:8000/api/v1/projects/1/transfer_start
```

The HTTP response is a 200 OK with an empty body response

## 10.30. Transfer accept

To accept the transfer of one project to your user send a POST request specifying the project id in the url and containing the following data:

- **token**: valid transfer token received by email.
- **reason**: text included in the email response to the project owner.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "reason": "testing",
    "token": "6:1buyee:MYrUHif5smCEniH0J731cId9q2w"
}' \
-s http://localhost:8000/api/v1/projects/2/transfer_accept
```

The HTTP response is a 200 OK with an empty body response

## 10.31. Transfer reject

To reject the transfer of one project to your user send a POST request specifying the project id in the url and containing the following data:

- **token**: valid transfer token received by email.
- **reason**: text included in the email response to the project owner.

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "reason": "testing",
    "token": "6:1buyed:Z64dQb1M495E1UczL0atESFKc8E"
}' \
-s http://localhost:8000/api/v1/projects/1/transfer_reject
```

The HTTP response is a 200 OK with an empty body response

# 11. Memberships/Invitations

## 11.1. List

To list memberships send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/memberships
```

The HTTP response is a 200 OK and the response body is a JSON list of [membership detail objects](#)

The results can be filtered using the following parameters:

- **project**: project id
- **role**: role id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/memberships?project=1
```

## 11.2. Create

To create memberships/invitations send a POST request with the following data:

- **project** (required)
- **role** (required): Role to the membership
- **email** (required): user email

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "email": "test-user@test.com",  
    "project": 1,  
    "role": 3  
' \  
-s http://localhost:8000/api/v1/memberships
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [membership detail object](#)

## 11.3. Bulk creation

To create multiple memberships at the same time send a POST request with the following data:

- **project\_id** (required)
- **bulk\_memberships** (required): a list of dicts with
  - **role\_id**
  - **email**
- **invitation\_extra\_text**: string

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_memberships": [
    {
      "email": "test@test.com",
      "role_id": 3
    },
    {
      "email": "john@doe.com",
      "role_id": 4
    }
  ],
  "project_id": 1
}' \
-s http://localhost:8000/api/v1/memberships/bulk_create
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON list of [membership detail object](#)

## 11.4. Get

To get a membership send a GET request specifying the membership id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/memberships/1
```

The HTTP response is a 200 OK and the response body is a JSON [membership detail object](#)

## 11.5. Edit

To edit memberships send a PUT or a PATCH specifying the membership id in the url. In a PATCH

request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "role": 3  
}' \  
-s http://localhost:8000/api/v1/memberships/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [membership detail object](#)

## 11.6. Delete

To delete memberships/invitations send a DELETE specifying the membership id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/memberships/2
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 11.7. Resend invitation

To resend an invitation send a POST request specifying the membership id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/memberships/1/resend_invitation
```

The HTTP response is a 200 OK and the response body is a JSON [membership detail object](#)

## 11.8. Get Invitation (by token)

To get an invitation send a GET request specifying the invitation id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/invitations/00000000-0000-0000-0000-000000000000
```

The HTTP response is a 200 OK and the response body is a JSON [membership detail object](#)

## 12. Milestones

### 12.1. List

To list milestones send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones
```

The HTTP response is a 200 OK and the response body is a JSON list of [milestone detail objects](#)

The results can be filtered using the following parameters:

- **project**: project ID
- **closed**: `true` to get only closed milestones or `false` to get only opened ones.

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones?project=1
```

When you filter milestones by project ID (`/api/v1/milestones?project=<projectId>`) the response has two new headers:

**NOTE**

- **Taiga-Info-Total-Opened-Milestones**: the number of opened milestones for this project.
- **Taiga-Info-Total-Closed-Milestones**: the number of closed milestones for this project.

### 12.2. Create

To create milestone send a POST request with the following data:

- **project** (required): project id
- **name** (required): string
- **estimated\_start** (required): iso date (YYYY-MM-DD)
- **estimated\_finish** (required): iso date (YYYY-MM-DD)
- **disponibility**: float
- **slug**: slug
- **order**: integer
- **watchers**: array of watcher id's

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "disponibility": 30,
    "estimated_finish": "2014-11-04",
    "estimated_start": "2014-10-20",
    "name": "Sprint 1",
    "order": 1,
    "project": 1,
    "slug": "sprint-1",
    "watchers": []
}' \
-s http://localhost:8000/api/v1/milestones
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "estimated_finish": "2014-11-04",
    "estimated_start": "2014-10-20",
    "name": "Sprint 3",
    "project": 1
}' \
-s http://localhost:8000/api/v1/milestones
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [milestone detail object](#)

## 12.3. Get

To get a milestone send a GET request specifying the milestone id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones/1
```

The HTTP response is a 200 OK and the response body is a JSON [milestone detail object](#)

## 12.4. Edit

To edit milestones send a PUT or a PATCH specifying the milestone id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "name": "Sprint 2"  
}' \  
-s http://localhost:8000/api/v1/milestones/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [milestone detail object](#)

## 12.5. Delete

To delete milestones send a DELETE specifying the milestone id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 12.6. Stats

To get the milestone stats send a GET request specifying the milestone id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones/1/stats
```

The HTTP response is a 200 OK and the response body is a JSON [milestone stats detail object](#)

## 12.7. Watch a milestone

To watch a milestone send a POST request specifying the milestone id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones/1/watch
```

The HTTP response is a 200 OK with an empty body response

## 12.8. Stop watching a milestone

To stop watching an milestone send a POST request specifying the milestone id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones/1/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 12.9. List milestone watchers

To get the list of watchers from a milestone send a GET request specifying the milestone id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/milestones/1/watchers
```

The HTTP response is a 200 OK and the response body is a JSON list of [milestone watcher object](#)

# 13. Epics

## 13.1. List

To list epics send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics
```

The HTTP response is a 200 OK and the response body is a JSON list of [epic list objects](#)

The results can be filtered using the following parameters:

- **project**: project id
- **project\_slug**: project slug
- **assigned\_to**: assigned to user id
- **status\_is\_closed**: boolean indicating if the epic status is closed

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics?project=1
```

## 13.2. Create

To create epics send a POST request with the following data:

- **assigned\_to**: user id
- **blocked\_note**: reason why the epic is blocked
- **description**: string
- **is\_blocked**: boolean
- **is\_closed**: boolean
- **color**: HEX color
- **project** (required): project id
- **subject** (required)
- **tags**: array of strings

- **watchers**: array of watcher id's

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "assigned_to": null,
    "blocked_note": "blocking reason",
    "client_requirement": false,
    "color": "#ABCABC",
    "description": "New epic description",
    "epics_order": 2,
    "is_blocked": true,
    "project": 1,
    "status": 2,
    "subject": "New epic",
    "tags": [
        "service catalog",
        "customer"
    ],
    "team_requirement": false,
    "watchers": []
}' \
-s http://localhost:8000/api/v1/epics
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "project": 1,
    "subject": "New epic"
}' \
-s http://localhost:8000/api/v1/epics
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [epic detail object](#)

### 13.3. Get

To get an epic send a GET request specifying the epic id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/1
```

The HTTP response is a 200 OK and the response body is a JSON [epic detail \(GET\) object](#)

## 13.4. Get by ref

To get an epic send a GET request specifying the epic reference and one of the following parameters:

- project (project id)
- project\_slug

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/by_ref?ref=106&project=2
```

The HTTP response is a 200 OK and the response body is a JSON [epic detail \(GET\) object](#)

## 13.5. Edit

To edit epics send a PUT or a PATCH specifying the epic id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "subject": "Patching subject",  
    "version": 1  
' \  
-s http://localhost:8000/api/v1/epics/10
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [epic detail object](#)

## 13.6. Delete

To delete epics send a DELETE specifying the epic id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/10
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 13.7. Bulk creation

To create multiple epics at the same time send a POST request with the following data:

- **project\_id** (required)
- **status\_id** (optional)
- **bulk\_epics**: epic subjects, one per line

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "bulk_epics": "EPIC 1 \n EPIC 2 \n EPIC 3",  
    "project_id": 1  
}' \  
-s http://localhost:8000/api/v1/epics/bulk_create
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON list of [epic detail object](#)

## 13.8. Filters data

To get the epic filters data send a GET request specifying the project id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/filters_data?project=1
```

The HTTP response is a 200 OK and the response body is a JSON [epic filters data object](#)

## 13.9. List related userstories

To get the list of related user stories from an epic send a GET request specifying the epic id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/10/related_userstories
```

The HTTP response is a 200 OK and the response body is a JSON list of [epic related user story detail objects](#)

## 13.10. Create related userstory

To create an epic related user story send a POST request with the following data:

- **epic**: related epic id
- **user\_story**: related user story id

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "epic": 10,  
    "user_story": 1  
}' \  
-s http://localhost:8000/api/v1/epics/10/related_userstories
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [epic related user story detail object](#)

## 13.11. Get related userstory

To get a related user story from an epic send a GET request specifying the epic and user story ids in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/10/related_userstories/37
```

The HTTP response is a 200 OK and the response body is a JSON [epic related user story detail object](#)

## 13.12. Edit related userstory

To edit epic related user stories send a PUT or a PATCH specifying the epic and user story ids in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "order": 100
}' \
-s http://localhost:8000/api/v1/epics/10/related_userstories/37
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [epic related user story detail object](#)

## 13.13. Delete related userstory

To delete epic related user stories send a DELETE specifying the epic and the userstory ids in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epics/10/related_userstories/37
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 13.14. Bulk related userstories creation

To create multiple related user stories at the same time send a POST request with the following data:

- **project\_id** (required)
- **bulk\_userstories**: user stories subjects, one per line

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "bulk_userstories": "epic 1 \n epic 2 \n epic 3",
    "project_id": 2
}' \
-s http://localhost:8000/api/v1/epics/10/related_userstories/bulk_create
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON list of [epic related user story detail object](#)

## 13.15. Vote an epic

To vote epics send a POST request specifying the epic id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epics/3/upvote
```

The HTTP response is a 200 OK with an empty body response

## 13.16. Remove vote from an epic

To remove a vote from an epic send a POST request specifying the epic id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epics/3/downvote
```

When remove of the vote succeeded, the HTTP response is a 200 OK with an empty body response

## 13.17. Get epic voters list

To get the list of voters from an epic send a GET request specifying the epic id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/1/voters
```

The HTTP response is a 200 OK and the response body is a JSON list of [epic voter object](#)

## 13.18. Watch an epic

To watch an epic send a POST request specifying the epic id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/10/watch
```

The HTTP response is a 200 OK with an empty body response

## 13.19. Stop watching an epic

To stop watching an epic send a POST request specifying the epic id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/10/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 13.20. List epic watchers

To get the list of watchers from an epic send a GET request specifying the epic id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/10/watchers
```

The HTTP response is a 200 OK and the response body is a JSON list of [epic watcher object](#)

## 13.21. List attachments

To list epic attachments send a GET request with the following parameters:

- **project**: project id
- **object\_id**: epic id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epics/attachments?object_id=642&project=1
```

The HTTP response is a 200 OK and the response body is a JSON list of [attachment detail objects](#)

## 13.22. Create attachment

To create epic attachments send a POST request with the following data:

- **object\_id** (required): epic id
- **project** (required): project id
- **attached\_file** (required): attaching file
- **description**
- **is\_deprecated**

```
curl -X POST \
-H "Content-Type: multipart/form-data" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-F attached_file=@test.png \
-F object_id=10 \
-F project=2 \
-s http://localhost:8000/api/v1/epics/attachments
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a [JSON attachment detail object](#)

## 13.23. Get attachment

To get an epic attachment send a GET request specifying the epic attachment id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/attachments/642
```

The HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 13.24. Edit attachment

To edit epic attachments send a PUT or a PATCH specifying the epic attachment id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "description": "Updated description"  
}' \  
-s http://localhost:8000/api/v1/epics/attachments/642
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 13.25. Delete attachment

To delete epic attachments send a DELETE specifying the epic attachment id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epics/attachments/642
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

# 14. Epic status

## 14.1. List

To list epic status send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epic-statuses
```

The HTTP response is a 200 OK and the response body is a JSON list of [epic status detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epic-statuses?project=1
```

## 14.2. Create

To create epic statuses send a POST request with the following data:

- **color:** in hexadecimal
- **is\_closed:** (true | false)
- **name** (required)
- **order:** integer
- **project:** (required): project id

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "color": "#AAAAAA",  
    "is_closed": true,  
    "name": "New status",  
    "order": 8,  
    "project": 1  
' \  
-s http://localhost:8000/api/v1/epic-statuses
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New status name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/epic-statuses
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [epic status detail object](#)

## 14.3. Get

To get an epic status send a GET request specifying the epic status id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epic-statuses/1
```

The HTTP response is a 200 OK and the response body is a JSON [epic status detail object](#)

## 14.4. Edit

To edit epic statuses send a PUT or a PATCH specifying the epic status id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Patch status name"
}' \
-s http://localhost:8000/api/v1/epic-statuses/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [epic status detail object](#)

## 14.5. Delete

To delete epic statuses send a DELETE specifying the epic status id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epic-statuses/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 14.6. Bulk update order

To update the order of multiple epic statuses at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_epic\_statuses**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "bulk_epic_statuses": [  
        [  
            1,  
            10  
        ],  
        [  
            2,  
            5  
        ]  
    ],  
    "project": 1  
}' \  
-s http://localhost:8000/api/v1/epic-statuses/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 15. Epic custom attribute

### 15.1. List

To list epic custom attributes send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epic-custom-attributes
```

The HTTP response is a 200 OK and the response body is a JSON list of [epic custom attribute detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/epic-custom-attributes?project=1
```

## 15.2. Create

To create epic custom attributes send a POST request with the following data:

- **name:** (required) text
- **description:** text
- **order:** integer
- **project:** (required) integer, project id

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "description": "Duration in minutes",  
    "name": "Duration 2",  
    "order": 8,  
    "project": 1  
}' \  
-s http://localhost:8000/api/v1/epic-custom-attributes
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Duration 3",
    "project": 1
}' \
-s http://localhost:8000/api/v1/epic-custom-attributes
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [epic custom attribute detail object](#)

## 15.3. Get

To get an epic custom attribute send a GET request specifying the epic custom attribute id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epic-custom-attributes/8
```

The HTTP response is a 200 OK and the response body is a JSON [epic custom attribute detail object](#)

## 15.4. Edit

To edit epic custom attributes send a PUT or a PATCH specifying the epic custom attribute id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Duration 1"
}' \
-s http://localhost:8000/api/v1/epic-custom-attributes/8
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [epic custom attribute detail object](#)

## 15.5. Delete

To delete epic custom attributes send a DELETE specifying the epic custom attribute id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epic-custom-attributes/8
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 15.6. Bulk update order

To update the order of multiple epic custom attributes at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_epic\_custom\_attributes**: list where each element is a list, the first element is the custom attribute id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_epic_custom_attributes": [
    [
      8,
      10
    ],
    [
      6,
      15
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/epic-custom-attributes/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 16. Epic custom attributes values

## 16.1. Get

To get an epic custom attribute value send a GET request specifying the epic custom attribute id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/epics/custom-attributes-values/10
```

The HTTP response is a 200 OK and the response body is a JSON [epic custom attribute detail object](#)

## 16.2. Edit

To edit epic custom attributes values send a PUT or a PATCH specifying the epic id in the url. "attribute\_values" must be a JSON object with pairs epic custom attribute id - value. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "attribute_values": {
    "8": "240 min"
  },
  "version": 1
}' \
-s http://localhost:8000/api/v1/epics/custom-attributes-values/10
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [epic custom attribute detail object](#)

## 17. User stories

### 17.1. List

To list user stories send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstories
```

The HTTP response is a 200 OK and the response body is a JSON list of [user story list objects](#)

The results can be filtered using the following parameters:

- **project**: project id
- **milestone**: milestone id
- **milestone\_isnull**: (true | false) if you are looking for user stories associated with a milestone or not
- **status**: status id
- **status\_is\_archived**: (true | false)
- **watchers**: watching user id
- **assigned\_to**: assigned to user id
- **status\_is\_closed**: (true | false)

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstories?project=1
```

## 17.2. Create

To create user stories send a POST request with the following data:

- **assigned\_to**: user id
- **backlog\_order**: order in the backlog
- **blocked\_note**: reason why the user story is blocked
- **client\_requirement**: boolean
- **description**: string
- **is\_blocked**: boolean
- **is\_closed**: boolean
- **kanban\_order**: order in the kanban
- **milestone**: milestone id
- **points**: dictionary of points

- **project** (required): project id
- **sprint\_order**: order in the milestone
- **status**: status id
- **subject** (required)
- **tags**: array of strings
- **team\_requirement**: boolean
- **watchers**: array of watcher id's

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "assigned_to": null,
  "backlog_order": 2,
  "blocked_note": "blocking reason",
  "client_requirement": false,
  "description": "Implement API CALL",
  "is_blocked": false,
  "is_closed": true,
  "kanban_order": 37,
  "milestone": null,
  "points": {
    "1": 4,
    "2": 3,
    "3": 2,
    "4": 1
  },
  "project": 1,
  "sprint_order": 2,
  "status": 2,
  "subject": "Customer personal data",
  "tags": [
    "service catalog",
    "customer"
  ],
  "team_requirement": false,
  "watchers": []
}' \
-s http://localhost:8000/api/v1/userstories
```

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "project": 1,  
    "subject": "Customer personal data"  
}' \  
-s http://localhost:8000/api/v1/userstories
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [user story detail object](#)

## 17.3. Get

To get a user story send a GET request specifying the user story id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstories/1
```

The HTTP response is a 200 OK and the response body is a JSON [user story detail \(GET\) object](#)

## 17.4. Get by ref

To get a user story send a GET request specifying the user story reference and one of the following parameters:

- project (project id)
- project\_slug

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstories/by_ref?ref=1&project=1
```

The HTTP response is a 200 OK and the response body is a JSON [user story detail \(GET\) object](#)

## 17.5. Edit

To edit user stories send a PUT or a PATCH specifying the user story id in the url. In a PATCH request

you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "subject": "Patching subject",
    "version": 1
}' \
-s http://localhost:8000/api/v1/userstories/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [user story detail object](#)

## 17.6. Delete

To delete user stories send a DELETE specifying the user story id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 17.7. Bulk creation

To create multiple user stories at the same time send a POST request with the following data:

- **project\_id** (required)
- **status\_id**
- **bulk\_stories**: user story subjects, one per line

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "bulk_stories": "US 1 \n US 2 \n US 3",
    "project_id": 1
}' \
-s http://localhost:8000/api/v1/userstories/bulk_create
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON list of [user story detail object](#)

## 17.8. Bulk update backlog order

To update the backlog order of multiple user stories at the same time send a POST request with the following data:

- **project\_id** (required)
- **bulk\_stories**: list where each element is a json object with two attributes, the user story id and the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_stories": [
    {
      "order": 10,
      "us_id": 1
    },
    {
      "order": 15,
      "us_id": 2
    }
  ],
  "project_id": 1
}' \
-s http://localhost:8000/api/v1/userstories/bulk_update_backlog_order
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON list of [user story detail object](#)

## 17.9. Bulk update kanban order

To update the kanban order of multiple user stories at the same time send a POST request with the following data:

- **project\_id** (required)
- **bulk\_stories**: list where each element is a json object with two attributes, the user story id and the new order

```

curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "bulk_stories": [
        {
            "order": 10,
            "us_id": 1
        },
        {
            "order": 15,
            "us_id": 2
        }
    ],
    "project_id": 1
}' \
-s http://localhost:8000/api/v1/userstories/bulk_update_kanban_order

```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON list of [user story detail object](#)

## 17.10. Bulk update sprint order

To update the sprint order of multiple user stories at the same time send a POST request with the following data:

- **project\_id** (required)
- **bulk\_stories**: list where each element is a json object with two attributes, the user story id and the new order

```

curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "bulk_stories": [
        {
            "order": 10,
            "us_id": 1
        },
        {
            "order": 15,
            "us_id": 2
        }
    ],
    "project_id": 1
}' \
-s http://localhost:8000/api/v1/userstories/bulk_update_sprint_order

```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON list of [user story detail object](#)

## 17.11. Bulk update milestone

To update the sprint of multiple user stories at the same time send a POST request with the following data:

- **project\_id** (required)
- **milestone\_id** (required)
- **bulk\_stories**: list where each element is a json object with two attributes, the user story id and the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_stories": [
    {
      "order": 10,
      "us_id": 1
    },
    {
      "order": 15,
      "us_id": 2
    }
  ],
  "milestone_id": 1,
  "project_id": 1
}' \
-s http://localhost:8000/api/v1/userstories/bulk_update_milestone
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 17.12. Filters data

To get the user stories filters data send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/filters_data?project=1
```

The HTTP response is a 200 OK and the response body is a JSON [user story filters data object](#)

## 17.13. Vote a user story

To add a vote to a user story send a POST request specifying the user story id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/1/upvote
```

The HTTP response is a 200 OK with an empty body response

## 17.14. Remove vote from a user story

To remove a vote from a user story send a POST request specifying the user story id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/1/downvote
```

When remove of the vote succeeded, the HTTP response is a 200 OK with an empty body response

## 17.15. Get user story voters list

To get the list of voters from a user story send a GET request specifying the user story id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/2/voters
```

The HTTP response is a 200 OK and the response body is a JSON list of [user story voter object](#)

## 17.16. Watch a user story

To watch a user story send a POST request specifying the project id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/1/watch
```

The HTTP response is a 200 OK with an empty body response

## 17.17. Stop watching a user story

To stop watching a user story send a POST request specifying the user story id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/1/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 17.18. List user story watchers

To get the list of watchers from a user story send a GET request specifying the user story id in the url

```
{
  "full_name": "GitLab",
  "id": 3,
  "username": "gitlab-13aa142f88564bd080fd984fd8fc9a01"
}
```

The HTTP response is a 200 OK and the response body is a JSON list of [user story watcher object](#)

## 17.19. List attachments

To list user story attachments send a GET request with the following parameters:

- **project**: project id
- **object\_id**: user story id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/attachments?object_id=1&project=1
```

The HTTP response is a 200 OK and the response body is a JSON list of [attachment detail objects](#)

## 17.20. Create attachment

To create user story attachments send a POST request with the following data:

- **object\_id** (required): user story id
- **project** (required): project id
- **attached\_file** (required): attaching file

- **description**
- **is\_deprecated**

```
curl -X POST \
-H "Content-Type: multipart/form-data" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-F attached_file=@test.png \
-F object_id=1 \
-F project=1 \
-s http://localhost:8000/api/v1/userstories/attachments
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [attachment detail object](#)

## 17.21. Get attachment

To get a user story attachment send a GET request specifying the user story attachment id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/attachments/415
```

The HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 17.22. Edit attachment

To edit user story attachments send a PUT or a PATCH specifying the user story attachment id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
      "description": "patching description"
}' \
-s http://localhost:8000/api/v1/userstories/attachments/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 17.23. Delete attachment

To delete user story attachments send a DELETE specifying the user story attachment id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstories/attachments/339
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 18. User story status

### 18.1. List

To list user story status send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstory-statuses
```

The HTTP response is a 200 OK and the response body is a JSON list of [user story status detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/userstory-statuses?project=1
```

### 18.2. Create

To create user story statuses send a POST request with the following data:

- **color:** in hexadecimal
- **is\_closed:** (true | false)
- **name** (required)

- **order**: integer
- **project**: (required): project id
- **wip\_limit**: integer representing the max number of user stories in this status

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "is_closed": true,
    "name": "New status",
    "order": 8,
    "project": 1,
    "wip_limit": 6
}' \
-s http://localhost:8000/api/v1/userstory-statuses
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New status name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/userstory-statuses
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [user story status detail object](#)

## 18.3. Get

To get a user story status send a GET request specifying the user story status id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstory-statuses/1
```

The HTTP response is a 200 OK and the response body is a JSON [user story status detail object](#)

## 18.4. Edit

To edit user story statuses send a PUT or a PATCH specifying the user story status id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Patch status name"
}' \
-s http://localhost:8000/api/v1/userstory-statuses/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [user story status detail object](#)

## 18.5. Delete

To delete user story statuses send a DELETE specifying the user story status id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstory-statuses/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 18.6. Bulk update order

To update the order of multiple user story statuses at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_userstory\_statuses**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_userstory_statuses": [
    [
      1,
      10
    ],
    [
      2,
      5
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/userstory-statuses/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 19. Points

### 19.1. List

To list points send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/points
```

The HTTP response is a 200 OK and the response body is a JSON list of [point detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/points?project=1
```

## 19.2. Create

To create points send a POST request with the following data:

- **color**: in hexadecimal
- **name** (required)
- **order**: integer
- **value** (required): integer
- **project**: (required): project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "name": "Huge",
    "order": 8,
    "project": 1,
    "value": 40
}' \
-s http://localhost:8000/api/v1/points
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Very huge",
    "project": 1
}' \
-s http://localhost:8000/api/v1/points
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [point detail object](#)

## 19.3. Get

To get a point send a GET request specifying the point id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/points/1
```

The HTTP response is a 200 OK and the response body is a JSON [point detail object](#)

## 19.4. Edit

To edit points send a PUT or a PATCH specifying the point id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "name": "Patch name"  
}' \  
-s http://localhost:8000/api/v1/points/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [point detail object](#)

## 19.5. Delete

To delete points send a DELETE specifying the point id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/points/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 19.6. Bulk update order

To update the order of multiple points at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_points**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_points": [
    [
      1,
      10
    ],
    [
      2,
      5
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/points/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 20. User story custom attribute

### 20.1. List

To list user story custom attributes send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstory-custom-attributes
```

The HTTP response is a 200 OK and the response body is a JSON list of [user story custom attribute detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstory-custom-attributes?project=1
```

## 20.2. Create

To create user story custom attributes send a POST request with the following data:

- **name**: (required) text
- **description**: text
- **order**: integer
- **project**: (required) integer, project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "description": "Duration in minutes",
    "name": "Duration 2",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/userstory-custom-attributes
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Duration 3",
    "project": 1
}' \
-s http://localhost:8000/api/v1/userstory-custom-attributes
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [user story custom attribute detail object](#)

## 20.3. Get

To get a user story custom attribute send a GET request specifying the user story custom attribute id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstory-custom-attributes/1
```

The HTTP response is a 200 OK and the response body is a JSON [user story custom attribute detail object](#)

## 20.4. Edit

To edit user story custom attributes send a PUT or a PATCH specifying the user story custom attribute id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Duration 1"
}' \
-s http://localhost:8000/api/v1/userstory-custom-attributes/1
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [user story custom attribute detail object](#)

## 20.5. Delete

To delete user story custom attributes send a DELETE specifying the user story custom attribute id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstory-custom-attributes/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 20.6. Bulk update order

To update the order of multiple user story custom attributes at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_userstory\_custom\_attributes**: list where each element is a list, the first element is the custom attribute id and the second the new order

```

curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "bulk_userstory_custom_attributes": [
        [
            1,
            10
        ],
        [
            2,
            5
        ]
    ],
    "project": 1
}' \
-s http://localhost:8000/api/v1/userstory-custom-attributes/bulk_update_order

```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 21. User story custom attributes values

### 21.1. Get

To get a user story custom attribute send a GET request specifying the user story custom attribute id in the url

```

curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/userstories/custom-attributes-values/1

```

The HTTP response is a 200 OK and the response body is a JSON [user story custom attribute detail object](#)

### 21.2. Edit

To edit user story custom attributes values send a PUT or a PATCH specifying the user story id in the url. "attribute\_values" must be a JSON object with pairs user story custom attribute id - value. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "attributes_values": {  
        "5": "240 min"  
    },  
    "version": 1  
' \  
-s http://localhost:8000/api/v1/userstories/custom-attributes-values/1
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [user story custom attribute detail object](#)

## 22. Tasks

### 22.1. List

To list tasks send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks
```

The HTTP response is a 200 OK and the response body is a JSON list of [task list objects](#)

The results can be filtered using the following parameters:

- **project**: project id
- **user\_story**: user story id
- **milestone**: milestone id
- **watchers**: watching user id
- **assigned\_to**: assigned to user id
- **status\_is\_closed**: (true | false)

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks?project=1
```

## 22.2. Create

To create tasks send a POST request with the following data:

- **assigned\_to**: user id
- **blocked\_note**: reason why the task is blocked
- **description**: string
- **is\_blocked**: boolean
- **is\_closed**: boolean
- **milestone**: milestone id
- **project** (required): project id
- **user\_story**: user story id
- **status**: status id
- **subject** (required)
- **tags**: array of strings
- **us\_order**: order in the user story,
- **taskboard\_order**: order in the taskboard,
- **is\_iocaine**: boolean,
- **external\_reference**: tuple of ("service", serviceId),
- **watchers**: array of watcher id's

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "assigned_to": null,
    "blocked_note": "blocking reason",
    "description": "Implement API CALL",
    "external_reference": null,
    "is_blocked": false,
    "is_closed": true,
    "is_iocaine": false,
    "milestone": null,
    "project": 1,
    "status": 1,
    "subject": "Customer personal data",
    "tags": [
        "service catalog",
        "customer"
    ],
    "taskboard_order": 1,
    "us_order": 1,
    "user_story": 17,
    "watchers": []
}' \
-s http://localhost:8000/api/v1/tasks
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "project": 1,
    "subject": "Customer personal data"
}' \
-s http://localhost:8000/api/v1/tasks
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON task detail object

## 22.3. Get

To get a task send a GET request specifying the task id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/tasks/1
```

The HTTP response is a 200 OK and the response body is a JSON task detail (GET) object

## 22.4. Get by ref

To get a task send a GET request specifying the task reference and one of the following parameters:

- project (project id)
  - project\_slug

```
[
  "eos",
  null
],
[
  "deleniti",
  null
]
],
"taskboard_order": 1476435809043,
"total_voters": 6,
"total_watchers": 1,
"us_order": 1476435809043,
"user_story": 1,
"user_story_extra_info": {
  "epics": null,
  "id": 1,
  "ref": 1,
  "subject": "Patching subject"
},
"version": 2,
"watchers": [
  6
]
}
```

The HTTP response is a 200 OK and the response body is a JSON [task detail \(GET\)](#) object

## 22.5. Edit

To edit tasks send a PUT or a PATCH specifying the task id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "subject": "Patching subject",
  "version": 1
}' \
-s http://localhost:8000/api/v1/tasks/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [task detail object](#)

## 22.6. Delete

To delete tasks send a DELETE specifying the task id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 22.7. Bulk creation

To create multiple tasks at the same time send a POST request with the following data:

- **project\_id** (required)
- **status\_id**
- **sprint\_id**: milestone id (optional)
- **us\_id**: user story id (optional)
- **bulk\_tasks**: task subjects, one per line

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "bulk_tasks": "Task 1 \n Task 2 \n Task 3",  
    "milestone_id": 1,  
    "project_id": 1  
}' \  
-s http://localhost:8000/api/v1/tasks/bulk_create
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON list of [task detail object](#)

## 22.8. Filters data

To get the task filters data send a GET request specifying the project id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/filters_data?project=1
```

The HTTP response is a 200 OK and the response body is a JSON [task filters data object](#)

## 22.9. Vote a task

To vote tasks send a POST request specifying the task id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/1/upvote
```

The HTTP response is a 200 OK with an empty body response

## 22.10. Remove vote from a task

To remove a vote from a task send a POST request specifying the task id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/1/downvote
```

When remove of the vote succeeded, the HTTP response is a 200 OK with an empty body response

## 22.11. Get task voters list

To get the list of voters from a task send a GET request specifying the task id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/1/voters
```

The HTTP response is a 200 OK and the response body is a JSON list of [task voter object](#)

## 22.12. Watch a task

To watch a task send a POST request specifying the task id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/tasks/1/watch
```

The HTTP response is a 200 OK with an empty body response

## 22.13. Stop watching a task

To stop watching a task send a POST request specifying the task id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/tasks/1/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 22.14. List task watchers

To get the list of watchers from a task send a GET request specifying the task id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/tasks/1/watchers
```

The HTTP response is a 200 OK and the response body is a JSON list of [task watcher object](#)

## 22.15. List attachments

To list task attachments send a GET request with the following parameters:

- **project**: project id
- **object\_id**: task id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/attachments?object_id=1&project=1
```

The HTTP response is a 200 OK and the response body is a JSON list of [attachment detail objects](#)

## 22.16. Create attachment

To create task attachments send a POST request with the following data:

- **object\_id** (required): task id
- **project** (required): project id
- **attached\_file** (required): attaching file
- **description**
- **is\_deprecated**

```
curl -X POST \  
-H "Content-Type: multipart/form-data" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-F attached_file=@test.png \  
-F object_id=1 \  
-F project=1 \  
-s http://localhost:8000/api/v1/tasks/attachments
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [attachment detail object](#)

## 22.17. Get attachment

To get a task attachment send a GET request specifying the task attachment id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/tasks/attachments/343
```

The HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 22.18. Edit attachment

To edit task attachments send a PUT or a PATCH specifying the task attachment id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "description": "Updated description"
}' \
-s http://localhost:8000/api/v1/tasks/attachments/343
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a [JSON attachment detail object](#)

## 22.19. Delete attachment

To delete task attachments send a DELETE specifying the task attachment id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/tasks/attachments/343
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 23. Task status

### 23.1. List

To list task status send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/task-statuses
```

The HTTP response is a 200 OK and the response body is a JSON list of [task status detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/task-statuses?project=1
```

## 23.2. Create

To create task statuses send a POST request with the following data:

- **color:** in hexadecimal
- **is\_closed:** (true | false)
- **name** (required)
- **order:** integer
- **project:** (required): project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "is_closed": true,
    "name": "New status",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/task-statuses
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New status name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/task-statuses
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [task status detail object](#)

## 23.3. Get

To get a task status send a GET request specifying the task status id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/task-statuses/1
```

The HTTP response is a 200 OK and the response body is a JSON [task status detail object](#)

## 23.4. Edit

To edit task statuses send a PUT or a PATCH specifying the task status id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Patch status name"
}' \
-s http://localhost:8000/api/v1/task-statuses/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [task status detail object](#)

## 23.5. Delete

To delete task statuses send a DELETE specifying the task status id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/task-statuses/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 23.6. Bulk update order

To update the order of multiple task statuses at the same time send a POST request with the following

data:

- **project** (required)
- **bulk\_task\_statuses**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_task_statuses": [
    [
      [
        1,
        10
      ],
      [
        [
          2,
          5
        ]
      ],
      "project": 1
    ]
  ]
}' \
-s http://localhost:8000/api/v1/task-statuses/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 24. Task custom attribute

### 24.1. List

To list task custom attributes send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/task-custom-attributes
```

The HTTP response is a 200 OK and the response body is a JSON list of [task custom attribute detail objects](#)

The results can be filtered using the following parameters:

- **project**: project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/task-custom-attributes?project=1
```

## 24.2. Create

To create task custom attributes send a POST request with the following data:

- **name**: (required) text
- **description**: text
- **order**: integer
- **project**: (required) integer, project id

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "description": "Duration in minutes",  
    "name": "Duration 2",  
    "order": 8,  
    "project": 1  
' \  
-s http://localhost:8000/api/v1/task-custom-attributes
```

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "name": "Duration 3",  
    "project": 1  
' \  
-s http://localhost:8000/api/v1/task-custom-attributes
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [task custom attribute detail object](#)

## 24.3. Get

To get a task custom attribute send a GET request specifying the task custom attribute id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/task-custom-attributes/5
```

The HTTP response is a 200 OK and the response body is a JSON [task custom attribute detail object](#)

## 24.4. Edit

To edit task custom attributes send a PUT or a PATCH specifying the task custom attribute id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "name": "Duration 1"  
}' \  
-s http://localhost:8000/api/v1/task-custom-attributes/5
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [task custom attribute detail object](#)

## 24.5. Delete

To delete task custom attributes send a DELETE specifying the task custom attribute id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/task-custom-attributes/5
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 24.6. Bulk update order

To update the order of multiple task custom attributes at the same time send a POST request with the following data:

- **project** (required)

- **bulk\_task\_custom\_attributes**: list where each element is a list, the first element is the custom attribute id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_task_custom_attributes": [
    [
      5,
      10
    ],
    [
      1,
      15
    ],
    "project": 1
  ]
}' \
-s http://localhost:8000/api/v1/task-custom-attributes/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 25. Task custom attributes values

### 25.1. Get

To get a task custom attribute send a GET request specifying the task custom attribute id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/task-custom-attributes/5
```

The HTTP response is a 200 OK and the response body is a JSON [task custom attribute detail object](#)

### 25.2. Edit

To edit task custom attributes values send a PUT or a PATCH specifying the task id in the url. "attribute\_values" must be a JSON object with pairs task custom attribute id - value. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "name": "Duration 1"  
}' \  
-s http://localhost:8000/api/v1/task-custom-attributes/5
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [task custom attribute detail object](#)

## 26. Issues

### 26.1. List

To list issues send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issues
```

The HTTP response is a 200 OK and the response body is a JSON list of [issue detail list objects](#)

The results can be filtered using the following parameters:

- **project**: project id
- **status**: status id
- **severity**: severity id
- **priority**: priority id
- **owner**: owner user id
- **assigned\_to**: assigned to user id
- **tags**: separated by ","
- **type**: issue type id
- **watchers**: watching user id
- **status\_is\_closed**: (true | false)

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issues?project=1
```

The results can be ordered using the `order_by` parameter with the values:

- `type`
- `severity`
- `status`
- `priority`
- `created_date`
- `modified_date`
- `owner`
- `assigned_to`
- `subject`

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issues?project=1&order_by=priority
```

## 26.2. Create

To create issues send a POST request with the following data:

- `assigned_to`: user id
- `blocked_note`: reason why the issue is blocked
- `description`: string
- `is_blocked`: boolean
- `is_closed`: boolean
- `milestone`: milestone id
- `project` (required): project id
- `status`: status id
- `severity`: severity id
- `priority`: priority id

- **type**: type id
- **subject** (required)
- **tags**: array of strings
- **watchers**: array of watcher id's

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "assigned_to": null,
    "blocked_note": "blocking reason",
    "description": "Implement API CALL",
    "is_blocked": false,
    "is_closed": true,
    "milestone": null,
    "priority": 3,
    "project": 1,
    "severity": 2,
    "status": 3,
    "subject": "Customer personal data",
    "tags": [
        "service catalog",
        "customer"
    ],
    "type": 1,
    "watchers": []
}' \
-s http://localhost:8000/api/v1/issues
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "project": 1,
    "subject": "Customer personal data"
}' \
-s http://localhost:8000/api/v1/issues
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON issue detail object

## 26.3. Get

To get an issue send a GET request specifying the issue id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3
```

The HTTP response is a 200 OK and the response body is a JSON [issue detail \(GET\)](#) object

## 26.4. Get by ref

To get an issue send a GET request specifying the issue reference and one of the following parameters:

- project (project id)
- project\_slug

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/by_ref?ref=119\&project=1
```

The HTTP response is a 200 OK and the response body is a JSON [issue detail \(GET\)](#) object

## 26.5. Edit

To edit issues send a PUT or a PATCH specifying the issue id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "subject": "Patching subject",
    "version": 1
}' \
-s http://localhost:8000/api/v1/issues/3
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [issue detail object](#)

## 26.6. Delete

To delete issues send a DELETE specifying the issue id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/23
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 26.7. Filters data

To get the issue filters data send a GET request specifying the project id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/filters_data?project=1
```

The HTTP response is a 200 OK and the response body is a JSON [issue filters data object](#)

## 26.8. Vote an issue

To vote issues send a POST specifying the issue id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3/upvote
```

When vote succeeded, the HTTP response is a 200 OK with an empty body response

## 26.9. Remove vote from an issue

To remove a vote from an issue send a POST specifying the issue id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3/downvote
```

When remove of the vote succeeded, the HTTP response is a 200 OK with an empty body response

## 26.10. Get issue voters list

To get the list of voters from an issue send a GET request specifying the issue id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3/voters
```

The HTTP response is a 200 OK and the response body is a JSON [issue voters detail object](#)

## 26.11. Watch an issue

To watch an issue send a POST request specifying the issue id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3/watch
```

The HTTP response is a 200 OK with an empty body response

## 26.12. Stop watching an issue

To stop watching an issue send a POST request specifying the issue id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 26.13. List issue watchers

To get the list of watchers from an issue send a GET request specifying the issue id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/3/watchers
```

The HTTP response is a 200 OK and the response body is a JSON list of [issue watcher object](#)

## 26.14. List attachments

To list issue attachments send a GET request with the following parameters:

- **project**: project id
- **object\_id**: issue id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/attachments?object_id=620&project=1
```

The HTTP response is a 200 OK and the response body is a JSON list of [attachment detail objects](#)

## 26.15. Create attachment

To create issue attachments send a POST request with the following data:

- **object\_id** (required): issue id
- **project** (required): project id
- **attached\_file** (required): attaching file
- **description**
- **is\_DEPRECATED**

```
curl -X POST \  
-H "Content-Type: multipart/form-data" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-F attached_file=@test.png \  
-F object_id=23 \  
-F project=1 \  
-s http://localhost:8000/api/v1/issues/attachments
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [attachment detail object](#)

## 26.16. Get attachment

To get an issue attachment send a GET request specifying the issue attachment id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issues/attachments/620
```

The HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 26.17. Edit attachment

To edit issue attachments send a PUT or a PATCH specifying the issue attachment id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issues/attachments/620
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 26.18. Delete attachment

To delete issue attachments send a DELETE specifying the issue attachment id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issues/attachments/620
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 27. Issue status

### 27.1. List

To list issue status send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issue-statuses
```

The HTTP response is a 200 OK and the response body is a JSON list of [issue status detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issue-statuses?project=1
```

### 27.2. Create

To create issue statuses send a POST request with the following data:

- **color:** in hexadecimal
- **is\_closed:** (true | false)
- **name** (required)
- **order:** integer
- **project:** (required): project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "is_closed": true,
    "name": "New status",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-statuses
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New status name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-statuses
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [issue status detail object](#)

## 27.3. Get

To get a issue status send a GET request specifying the issue status id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-statuses/1
```

The HTTP response is a 200 OK and the response body is a JSON [issue status detail object](#)

## 27.4. Edit

To edit issue statuses send a PUT or a PATCH specifying the issue status id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "subject": "Patching subject",  
    "version": 1  
' \  
-s http://localhost:8000/api/v1/issues/3
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [issue status detail object](#)

## 27.5. Delete

To delete issue statuses send a DELETE specifying the issue status id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/issue-statuses/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 27.6. Bulk update order

To update the order of multiple issue statuses at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_issue\_statuses**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_issue_statuses": [
    [
      1,
      10
    ],
    [
      2,
      5
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/issue-statuses/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 28. Issue types

### 28.1. List

To list issue types send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-types
```

The HTTP response is a 200 OK and the response body is a JSON list of [issue type detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-types?project=1
```

## 28.2. Create

To create issue types send a POST request with the following data:

- **color**: in hexadecimal
- **name** (required)
- **order**: integer
- **project**: (required): project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "name": "New type",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-types
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New type name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-types
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [issue type detail object](#)

## 28.3. Get

To get an issue type send a GET request specifying the issue type id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-types/1
```

The HTTP response is a 200 OK and the response body is a JSON [issue type detail object](#)

## 28.4. Edit

To edit issue types send a PUT or a PATCH specifying the issue type id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Patch type name"
}' \
-s http://localhost:8000/api/v1/issue-types/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [issue type detail object](#)

## 28.5. Delete

To delete issue statuses send a DELETE specifying the issue type id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-types/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 28.6. Bulk update order

To update the order of multiple issue types at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_issue\_types**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_issue_types": [
    [
      1,
      10
    ],
    [
      2,
      5
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/issue-types/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 29. Priorities

### 29.1. List

To list priorities send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/priorities
```

The HTTP response is a 200 OK and the response body is a JSON list of [priority detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/priorities?project=1
```

## 29.2. Create

To create priorities send a POST request with the following data:

- **color**: in hexadecimal
- **name** (required)
- **order**: integer
- **project**: (required): project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "name": "New priority",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/priorities
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New priority name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/priorities
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [priority detail object](#)

## 29.3. Get

To get a priority send a GET request specifying the priority id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/priorities/1
```

The HTTP response is a 200 OK and the response body is a JSON [priority detail object](#)

## 29.4. Edit

To edit priorities send a PUT or a PATCH specifying the priority id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Patch name"
}' \
-s http://localhost:8000/api/v1/priorities/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [priority detail object](#)

## 29.5. Delete

To delete priorities send a DELETE specifying the priority id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/priorities/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 29.6. Bulk update order

To update the order of multiple priorities at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_priorities**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_priorities": [
    [
      1,
      10
    ],
    [
      2,
      5
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/priorities/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 30. Severities

### 30.1. List

To list severities send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/severities
```

The HTTP response is a 200 OK and the response body is a JSON list of [severity detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/severities?project=1
```

## 30.2. Create

To create severities send a POST request with the following data:

- **color**: in hexadecimal
- **name** (required)
- **order**: integer
- **project**: (required): project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "color": "#AAAAAA",
    "name": "New severity",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/severities
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "New severity name",
    "project": 1
}' \
-s http://localhost:8000/api/v1/severities
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a [JSON severity detail object](#)

## 30.3. Get

To get a severity send a GET request specifying the severity id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/severities/1
```

The HTTP response is a 200 OK and the response body is a JSON [severity detail object](#)

## 30.4. Edit

To edit severities send a PUT or a PATCH specifying the severity id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Patch name"
}' \
-s http://localhost:8000/api/v1/severities/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [severity detail object](#)

## 30.5. Delete

To delete severities send a DELETE specifying the severity id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/severities/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 30.6. Bulk update order

To update the order of multiple severities at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_severities**: list where each element is a list, the first element is the status id and the second the new order

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
  "bulk_severities": [
    [
      1,
      10
    ],
    [
      2,
      5
    ]
  ],
  "project": 1
}' \
-s http://localhost:8000/api/v1/severities/bulk_update_order
```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 31. Issue custom attribute

### 31.1. List

To list issue custom attributes send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-custom-attributes
```

The HTTP response is a 200 OK and the response body is a JSON list of [issue custom attribute detail objects](#)

The results can be filtered using the following parameters:

- **project:** project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-custom-attributes?project=1
```

## 31.2. Create

To create issue custom attributes send a POST request with the following data:

- **name**: (required) text
- **description**: text
- **order**: integer
- **project**: (required) integer, project id

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "description": "Duration in minutes",
    "name": "Duration 2",
    "order": 8,
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-custom-attributes
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Duration 3",
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-custom-attributes
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [issue custom attribute detail object](#)

## 31.3. Get

To get a issue custom attribute send a GET request specifying the issue custom attribute id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-custom-attributes/5
```

The HTTP response is a 200 OK and the response body is a JSON [issue custom attribute detail object](#)

## 31.4. Edit

To edit issue custom attributes send a PUT or a PATCH specifying the issue custom attribute id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "name": "Duration 1"
}' \
-s http://localhost:8000/api/v1/issue-custom-attributes/5
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [issue custom attribute detail object](#)

## 31.5. Delete

To delete issue custom attributes send a DELETE specifying the issue custom attribute id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issue-custom-attributes/5
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 31.6. Bulk update order

To update the order of multiple issue custom attributes at the same time send a POST request with the following data:

- **project** (required)
- **bulk\_issue\_custom\_attributes**: list where each element is a list, the first element is the custom attribute id and the second the new order

```

curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "bulk_issue_custom_attributes": [
        [
            5,
            10
        ],
        [
            4,
            5
        ]
    ],
    "project": 1
}' \
-s http://localhost:8000/api/v1/issue-custom-attributes/bulk_update_order

```

When the update is successful, the HTTP response is a 204 NO CONTENT with an empty body response

## 32. Issue custom attributes values

### 32.1. Get

To get a issue custom attribute send a GET request specifying the issue custom attribute id in the url

```

curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/issues/custom-attributes-values/23

```

The HTTP response is a 200 OK and the response body is a JSON [issue custom attribute detail object](#)

### 32.2. Edit

To edit issue custom attributes values send a PUT or a PATCH specifying the issue id in the url. "attribute\_values" must be a JSON object with pairs issue custom attribute id - value. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "attributes_values": {  
        "5": "240 min"  
    },  
    "version": 1  
' \  
-s http://localhost:8000/api/v1/issues/custom-attributes-values/23
```

When the update is successful, the HTTP response is a 200 OK and the response body is a JSON [issue custom attribute detail object](#)

## 33. Wiki pages

### 33.1. List

To list wiki pages send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki
```

The HTTP response is a 200 OK and the response body is a JSON list of [wiki page detail objects](#)

The results can be filtered using the following parameters:

- **project**: project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki?project=1
```

### 33.2. Create

To create wiki pages send a POST request with the following data:

- **project** (required): project id

- **slug** (required): slug
- **content** (required): string
- **watchers**: array of watcher id's

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "content": "Lorem ipsum dolor.",
    "project": 1,
    "slug": "new-page",
    "watchers": []
}' \
-s http://localhost:8000/api/v1/wiki
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "content": "Lorem ipsum dolor.",
    "project": 1,
    "slug": "new-simple-page"
}' \
-s http://localhost:8000/api/v1/wiki
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [wiki page detail object](#)

### 33.3. Get

To get a wiki page send a GET request specifying the wiki page id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/wiki/6
```

The HTTP response is a 200 OK and the response body is a JSON [wiki page detail object](#)

### 33.4. Get by slug

To get a wiki page send a GET request specifying the wiki page slug and the project id as parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/by_slug?slug=home&project=1
```

The HTTP response is a 200 OK and the response body is a JSON [wiki page detail object](#)

## 33.5. Edit

To edit wiki pages send a PUT or a PATCH specifying the wiki page id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "subject": "Patching subject",  
    "version": 1  
}' \  
-s http://localhost:8000/api/v1/wiki/6
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [wiki page detail object](#)

## 33.6. Delete

To delete wiki page send a DELETE specifying the wiki page id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/6
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 33.7. Watch a wiki page

To watch a wiki page send a POST request specifying the wiki page id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/6/watch
```

The HTTP response is a 200 OK with an empty body response

## 33.8. Stop watching a wiki page

To stop watching a wiki page send a POST request specifying the wiki page id in the url

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/6/unwatch
```

The HTTP response is a 200 OK with an empty body response

## 33.9. List wiki page watchers

To get the list of watchers from a wiki page send a GET request specifying the wiki page id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/6/watchers
```

The HTTP response is a 200 OK and the response body is a JSON list of [wiki page watcher](#) object

## 33.10. List attachments

To list wiki page attachments send a GET request with the following parameters:

- **project**: project id
- **object\_id**: wiki page id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/attachments?object_id=6&project=1
```

The HTTP response is a 200 OK and the response body is a JSON list of [attachment detail objects](#)

## 33.11. Create attachment

To create wiki page attachments send a POST request with the following data:

- **object\_id** (required): wiki page id
- **project** (required): project id
- **attached\_file** (required): attaching file
- **description**
- **is\_DEPRECATED**

```
{  
  "attached_file":  
    "attachments/6/4/8/8/de60dfc7165c22f52d8c0fa427027ad0c6e07d64e9739ea5ff87d1aec1b5/sample_  
    attachment_1.txt",  
    "created_date": "2016-10-14T09:05:18.959Z",  
    "description": "Updated description",  
    "id": 623,  
    "is_DEPRECATED": true,  
    "modified_date": "2016-10-14T09:20:31.871Z",  
    "name": "sample_attachment_1.txt",  
    "object_id": 7,  
    "order": 1,  
    "owner": 14,  
    "project": 2,  
    "sha1": "e9913a16efd01bf9b44d712cf601802fdc8869ea",  
    "size": 289,  
    "thumbnail_card_url": null,  
    "url":  
      "http://localhost:8000/media/attachments/6/4/8/8/de60dfc7165c22f52d8c0fa427027ad0c6e07d64  
      e9739ea5ff87d1aec1b5/sample_attachment_1.txt"  
}
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [attachment detail object](#)

## 33.12. Get attachment

To get an wiki page attachment send a GET request specifying the wiki page attachment id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/attachments/623
```

The HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 33.13. Edit attachment

To edit wiki page attachments send a PUT or a PATCH specifying the wiki page attachment id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "description": "Updated description"  
}' \  
-s http://localhost:8000/api/v1/wiki/attachments/623
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [attachment detail object](#)

## 33.14. Delete attachment

To delete wiki page attachments send a DELETE specifying the wiki page attachment id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki/attachments/623
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

# 34. Wiki links

## 34.1. List

To list wiki links send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki-links
```

The HTTP response is a 200 OK and the response body is a JSON list of [wiki link detail objects](#)

The results can be filtered using the following parameters:

- **project**: project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/wiki-links?project=1
```

## 34.2. Create

To create wiki links send a POST request with the following data:

- **project** (required): project id
- **title** (required): string
- **href** (required): wiki page slug
- **order**: integer

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "href": "home",  
    "order": 1,  
    "project": 1,  
    "title": "Home page"  
}' \  
-s http://localhost:8000/api/v1/wiki-links
```

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "href": "home",
    "project": 1,
    "title": "Home page"
}' \
-s http://localhost:8000/api/v1/wiki-links
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON [wiki link detail object](#)

### 34.3. Get

To get a wiki link send a GET request specifying the wiki link id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/wiki-links/1
```

The HTTP response is a 200 OK and the response body is a JSON [wiki link detail object](#)

### 34.4. Edit

To edit wiki links send a PUT or a PATCH specifying the wiki link id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "subject": "Patching subject"
}' \
-s http://localhost:8000/api/v1/wiki-links/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [wiki link detail object](#)

## 34.5. Delete

To delete wiki link send a DELETE specifying the wiki link id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/wiki-links/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 35. History

### 35.1. Get user story, task, issue or wiki page history

To get the history of a user story, task, issue or wiki page send a GET request specifying the id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/history/userstory/2
```

The HTTP response is a 200 OK and the response body is a JSON of a list of [history entry detail objects](#)

### 35.2. Get comment versions

To get the comment versions from the history entry of a user story, task, issue or wiki page send a GET request specifying the history entry id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/history/userstory/2/comment_versions?id=00000000-0000-0000-0000-000000000000
```

The HTTP response is a 200 OK and the response body is a JSON of a list of [history entry comment detail objects](#)

### 35.3. Edit comment

To edit a history comment send a POST specifying the history entry id in the url with the following data:

- **assigned\_to**: the new comment

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "comment": "comment edition"
}' \
-s http://localhost:8000/api/v1/history/userstory/2/edit_comment?id=00000000-0000-0000-0000-000000000000
```

When deleted successfully, the HTTP response is a 204 NO CONTENT with an empty body response

### 35.4. Delete comment

To delete a history comment send a POST specifying the history entry id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/history/userstory/2/delete_comment?id=00000000-0000-0000-0000-000000000000
```

When deleted successfully, the HTTP response is a 204 NO CONTENT with an empty body response

### 35.5. Undelete comment

To undelete a history comment send a POST specifying the history entry id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/history/userstory/2/undelete_comment?id=00000000-0000-0000-0000-000000000000
```

When deleted successfully, the HTTP response is a 204 NO CONTENT with an empty body response

# 36. Users

## 36.1. List

To list users send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users
```

The HTTP response is a 200 OK and the response body is a JSON list of [user detail objects](#)

The results can be filtered using the following parameters:

- **project**: project id

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users?project=1
```

## 36.2. Get

To get a user send a GET request specifying the user id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users/6
```

The HTTP response is a 200 OK and the response body is a JSON [user detail object](#)

## 36.3. Me

To get your own user send a GET request to the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users/me
```

The HTTP response is a 200 OK and the response body is a JSON [user detail object](#)

## 36.4. Get user stats

To get the stats from a user send a GET request specifying the user id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users/6/stats
```

The HTTP response is a 200 OK and the response body is a JSON [user stats object](#)

## 36.5. Get watched content

To get the user watched content send a GET request specifying the user id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users/1/watched
```

The HTTP response is a 200 OK and the response body is a list of JSON [watched detail object](#)

The results can be filtered using the following parameters:

- **type**: of the content. Possible values: project, userstory, task and issue
- **q**: text to search in the subject of the element

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/users/1/watched?type=project&q=test
```

## 36.6. Get liked content

To get the user liked content send a GET request specifying the user id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/6/liked
```

The HTTP response is a 200 OK and the response body is a list of JSON [liked detail object](#)

The results can be filtered using the following parameters:

- **q**: text to search in the subject of the element

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/6/liked?q=test
```

## 36.7. Get voted content

To get the user voted content send a GET request specifying the user id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/6/voted
```

The HTTP response is a 200 OK and the response body is a list of JSON [voted detail object](#)

The results can be filtered using the following parameters:

- **type**: of the content. Possible values: userstory, task and issue
- **q**: text to search in the subject of the element

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/6/liked?q=test
```

## 36.8. Edit

To edit users send a PUT or a PATCH specifying the user id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "username": "patchedusername"
}' \
-s http://localhost:8000/api/v1/users/6
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [user detail object](#)

## 36.9. Delete

To delete users send a DELETE specifying the user id in the url

```
curl -X DELETE \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${ADMIN_AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/10
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 36.10. Get contacts

To get a user contacts send a GET request specifying the user id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/6/contacts
```

The HTTP response is a 200 OK and the response body is a list of JSON [contact detail object](#)

## 36.11. Cancel

To cancel a user account send a POST with the following data

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "cancel_token": "eyJ1c2VYX2NhbmNlbF9hY2NvdW50X2lkIjo2fQ:1buyee:wx1HwVGDiHy6K2RlpVb0P3S_b6c"
}' \
-s http://localhost:8000/api/v1/users/cancel
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 36.12. Change avatar

To change your user avatar send a POST with the following data

```
curl -X POST \
-H "Content-Type: multipart/form-data" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-F avatar=@test.png \
-s http://localhost:8000/api/v1/users/change_avatar
```

When the change is successful, the HTTP response is a 200 OK and the response body is a JSON [user detail object](#)

## 36.13. Remove avatar

To remove your user avatar send a POST with the following data

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/users/remove_avatar
```

When the change is successful, the HTTP response is a 200 OK and the response body is a JSON [user detail object](#)

## 36.14. Change email

To change your user email send a POST with the following data

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "email_token": "email-token"
}' \
-s http://localhost:8000/api/v1/users/change_email
```

When the change is successful, the HTTP response is a 200 OK and the response body is a JSON [user detail object](#)

## 36.15. Change password

To change your user password send a POST with the following data

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "current_password": "123123",
    "password": "new-password"
}' \
-s http://localhost:8000/api/v1/users/change_password
```

When the change succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 36.16. Password recovery

To request a user password recovery send a POST with the following data:

- **username** (required): this field also supports the user email

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "username": "user1"
}' \
-s http://localhost:8000/api/v1/users/password_recovery
```

When the password recovery request succeeded, the HTTP response is a 200 OK and the response body is a JSON object:

```
{  
  "detail": "\u00a1Correo enviado con \u00e9xito!"  
}
```

## 36.17. Change password from recovery

To change a user password from a request recovery send a POST with the following data

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
  "password": "new-password",  
  "token": "password-token"  
' \  
-s http://localhost:8000/api/v1/users/change_password_from_recovery
```

When the password change succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 37. Notify policies

### 37.1. List

To list the notify policies of the current user send a GET request with the following parameters:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/notify-policies
```

The HTTP response is a 200 OK and the response body is a JSON list of [notify policy detail objects](#)

### 37.2. Get

To get a notify policy send a GET request specifying the notify policy id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/notify-policies/4
```

The HTTP response is a 200 OK and the response body is a JSON [notify policy detail object](#)

## 37.3. Edit

To edit notify policies send a PUT or a PATCH specifying the notify policy id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "notify_level": 2  
}' \  
-s http://localhost:8000/api/v1/notify-policies/4
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [notify policy detail object](#)

# 38. Feedback

## 38.1. Create

To create feedback send a POST request with the following data:

- **comment** (required)

```
curl -X POST \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "comment": "Testing feedback"  
}' \  
-s http://localhost:8000/api/v1/feedback
```

When created successfully, the HTTP response is a 201 Created and the response body is a JSON [feedback object](#)

# 39. Export/Import

## 39.1. Export

To get a project dump send a GET request with the project id:

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/exporter/1
```

Depending on server configuration it can return two results:

- If taiga is working in synchronous mode the json file is directly generated, the result is a 200 OK and as response body a JSON of [export detail for synch mode](#).
- If taiga is working in asynchronous mode the result is a 202 Accepted and as response body a JSON of [export request accepted](#). The export\_id can be used to build the URL to download the exported file when the file generation is complete, those urls look like: MEDIA\_URL/exports/PROJECT\_ID/PROJECT\_SLUG-export\_id.json.

## 39.2. Import

To load a project dump send a POST request with the following file:

- **dump** (required)

```
curl -X POST \  
-H "Content-Type: multipart/form-data" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-F dump=@dump.json \  
-s http://localhost:8000/api/v1/importer/load_dump
```

Depending on server configuration it can return two results:

- A 202 Accepted and as response body a JSON of [import request accepted](#).
- A 201 Created and the response body is a JSON of [project detail object](#)

# 40. Webhooks

## 40.1. List

To list webhooks send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooks
```

The HTTP response is a 200 OK and the response body is a JSON list of [webhook detail objects](#)

The results can be filtered using the following parameters:

- **project**: project id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooks?project=1
```

## 40.2. Create

To create webhook send a POST request with the following data:

- **project** (required): project id
- **name** (required): string
- **url** (required): payload url
- **key** (required): secret key

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-d '{
    "key": "my-very-secret-key",
    "name": "My service webhook",
    "project": 1,
    "url": "http://myservice.com/webhooks"
}' \
-s http://localhost:8000/api/v1/webhooks
```

When the creation is successful, the HTTP response is a 201 Created and the response body is a JSON

[webhook detail object](#)

## 40.3. Get

To get a webhook send a GET request specifying the webhook id in the url

```
curl -X GET \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/webhooks/1
```

The HTTP response is a 200 OK and the response body is a JSON [webhook detail object](#)

## 40.4. Edit

To edit a webhook send a PUT or a PATCH specifying the webhook id in the url. In a PATCH request you just need to send the modified data, in a PUT one the whole object must be sent.

```
curl -X PATCH \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-d '{  
    "name": "My service name"  
}' \  
-s http://localhost:8000/api/v1/webhooks/1
```

When the creation is successful, the HTTP response is a 200 OK and the response body is a JSON [webhook detail object](#)

## 40.5. Delete

To delete a webhook send a DELETE specifying the webhook id in the url

```
curl -X DELETE \  
-H "Content-Type: application/json" \  
-H "Authorization: Bearer ${AUTH_TOKEN}" \  
-s http://localhost:8000/api/v1/webhooks/1
```

When delete succeeded, the HTTP response is a 204 NO CONTENT with an empty body response

## 40.6. Test

To test a webhook send a POST request specifying the webhook id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooks/1/test
```

The HTTP response is a 200 OK and the response body is a JSON [webhook log detail object](#) with the result of the test.

## 40.7. Logs list

To list webhook logs send a GET request to the url:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooklogs
```

The HTTP response is a 200 OK and the response body is a JSON list of [webhook log detail objects](#)

The results can be filtered using the following parameters:

- **webhook**: webhook id

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooklogs?webhook=1
```

## 40.8. Log get

To get a webhook log send a GET request specifying the webhook log id in the url

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooklogs/1
```

The HTTP response is a 200 OK and the response body is a JSON [webhook log detail object](#)

## 40.9. Resend request

To resend a request from a webhook log send a POST request specifying the webhook log id in the url

```
curl -X POST \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/webhooklogs/1/resend
```

The HTTP response is a 200 OK and the response body is a JSON [webhook log detail object](#) with the result of the resend.

# 41. Timelines

## 41.1. List user timeline

To list a user timeline send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/timeline/user/1
```

This API call returns only actions directly executed by the specified user.

The HTTP response is a 200 OK and the response body is a JSON list of [timeline entry detail](#)

## 41.2. List profile timeline

To list a profile timeline send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/timeline/profile/1
```

This API call returns actions executed by the specified user and related to them, watching objects, actions by related team members, belonging to projects...

The HTTP response is a 200 OK and the response body is a JSON list of [timeline entry detail](#)

## 41.3. List project timeline

To list a project timeline send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/timeline/project/1
```

This API call returns actions executed by different users related to the specified project.

The HTTP response is a 200 OK and the response body is a JSON list of [timeline entry detail](#)

## 42. Locales

### 42.1. List

To list the available locales send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/locales
```

The HTTP response is a 200 OK and the response body is a JSON list of [locale objects](#)

## 43. Stats

### 43.1. Get discover stats

To get the discover stats send a GET request with the following parameters:

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/stats/discover
```

The HTTP response is a 200 OK and the response body is a JSON [discover stats object](#)

## 43.2. Get system stats

To get the discover stats send a GET request with the following parameters:

**NOTE** This API will only work if your instance has system stats enabled

```
curl -X GET \
-H "Content-Type: application/json" \
-H "Authorization: Bearer ${AUTH_TOKEN}" \
-s http://localhost:8000/api/v1/stats/system
```

The HTTP response is a 200 OK and the response body is a JSON [system stats](#) object

## 44. Objects Summary

### 44.1. Attachment

## 46. Contrib plugins

Taiga allows adding features through contrib plugins, each plugin can add new API endpoints, and has its own documentation.

Current supported contrib plugins that adding endpoints:

- taiga-contrib-slack: Slack integration ([documentation](#))
- taiga-contrib-hall: Hall.com integration ([documentation](#))
